Pure Storage Pure Certified Portworx Enterprise Professional (PEP) Exam Sample Questions (Q58-Q63):

NEW QUESTION # 58

A Portworx administrator wants to create a storage class that can be used to create volumes with the following characteristics:

* Encrypted volume

* Two replicas

Which definition should the administrator use?

- A. kind: StorageClass
apiVersion: storage.k8s.io/v1
metadata:
name: px-encrypted
provisioner: kubernetes.io/portworx-volume
parameters:
encrypted: "true"
repl: "2"
- B. kind: StorageClass
apiVersion: storage.k8s.io/v1
metadata:
name: px-encrypted
provisioner: kubernetes.io/portworx-volume
parameters:
sharedv4: "true"
repl: "2"
- C. kind: StorageClass
apiVersion: storage.k8s.io/v1
metadata:
name: px-encrypted
provisioner: kubernetes.io/portworx-volume
parameters:
secure: "true"
repl: "2"

Answer: A

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

To create a StorageClass in Kubernetes for Portworx volumes that are encrypted and replicated twice, the correct parameters are encrypted: "true" to enable encryption and repl: "2" to specify two replicas. Option A accurately sets these parameters, ensuring volumes provisioned with this StorageClass will be encrypted at rest and maintain two replicas for data redundancy. Option B uses

sharedv4: "true", which relates to NFS-like sharing, not encryption. Option C uses secure: "true", which is not the recognized parameter for enabling encryption in Portworx StorageClass definitions. The official Portworx StorageClass parameter documentation confirms encrypted as the correct flag for encryption and repl to specify replication factor, enabling administrators to enforce data security and availability policies declaratively through Kubernetes manifests **【Pure Storage Portworx StorageClass Guide source】** .

NEW QUESTION # 59

A cluster administrator wants to define an Autopilot rule for Portworx. What are the 4 main parts of an Autopilot rule?

- A. Enforcement, Match Expressions, Topology Key and Weight
- **B. Selector, Namespace Selector, Conditions and Actions**
- C. Replica, I/O profile, Secure, Placement Strategy

Answer: B

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

An Autopilot rule in Portworx consists of four main parts: Selector, Namespace Selector, Conditions, and Actions. The Selector defines the set of volumes or pods the rule applies to, often using labels. Namespace Selector further narrows the scope to specific Kubernetes namespaces, allowing targeted policy application. Conditions specify triggers or thresholds such as capacity utilization, I/O metrics, or time-based schedules. When conditions are met, the Actions section defines automated responses such as volume expansion, migration, or alerting. This modular rule design enables flexible, policy-driven automation for storage management, helping maintain cluster health and performance without manual intervention. The Portworx Autopilot documentation provides detailed schema and examples, emphasizing these components as foundational for dynamic, autonomous cluster operation **【Pure Storage Portworx Autopilot Guide source】** .

NEW QUESTION # 60

What command allows a Portworx admin to create a cloud credential for the Object Store?

- **A. pxctl credentials create**
- B. pxctl credentials generate
- C. pxctl service credentials create

Answer: A

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

In Portworx, managing credentials for cloud object stores is vital to enable features like cloud snapshots and backups. The command `pxctl credentials create` is used to create and register cloud credentials with the Portworx cluster. This command allows administrators to specify provider details such as AWS, Google Cloud, or Azure, and input necessary access keys, secret keys, regions, and endpoints. Proper credential configuration enables Portworx to authenticate with external object stores securely, ensuring reliable data movement and disaster recovery operations. The CLI facilitates easy credential management, including listing, updating, and deleting credentials as needed. Official Portworx documentation highlights `pxctl credentials create` as the authoritative command for establishing cloud storage access, ensuring security best practices by managing credentials centrally within the Portworx control plane **【Pure Storage Portworx CLI Guide source】** .

NEW QUESTION # 61

What is a benefit of using Autopilot in Portworx environments?

- **A. It automates the expansion of storage volumes based on predefined rules.**
- B. Provides enhanced security features for data protection.
- C. It facilitates the migration of containers across clusters.

Answer: A

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

Autopilot is a key feature in Portworx designed to automate operational tasks such as capacity management and volume resizing. One of its primary benefits is automating the expansion of storage volumes based on predefined rules and thresholds. This means that when a volume approaches its storage limit, Autopilot can automatically trigger volume expansion without manual intervention, ensuring applications have uninterrupted access to storage resources. This automation reduces operational overhead, eliminates manual errors, and helps maintain application performance and availability. While Autopilot doesn't directly handle container migration or security enhancements, its dynamic volume management capabilities play a critical role in operational efficiency and business continuity. The Portworx documentation highlights Autopilot as a tool for intelligent, policy-driven storage management that adapts to workload demands in real time **【 Pure Storage Portworx Autopilot Guide source 】** .

NEW QUESTION # 62

What is a key benefit of using on-demand snapshots in a Kubernetes environment with Portworx?

- A. They automatically scale storage capacity.
- B. They require no additional configuration after the initial setup.
- C. They provide immediate data recovery options without stopping applications.

Answer: C

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

On-demand snapshots in Portworx allow administrators and applications to create point-in-time copies of volumes instantly without requiring downtime or interrupting running workloads. This capability is critical in Kubernetes environments where high availability and continuous operation are mandatory. Snapshots capture the exact state of data at a moment, enabling rapid recovery from accidental deletion, corruption, or ransomware attacks. Since these snapshots are created live, applications continue to run seamlessly, ensuring minimal impact on user experience. Portworx's snapshot technology uses efficient -on-write mechanisms, which also minimize storage overhead. Official Portworx documentation emphasizes that on-demand snapshots enhance data protection strategies by enabling quick backups and restores without requiring maintenance windows or complex scheduling **【 Pure Storage Portworx Snapshot Guide source 】** .
