## EMC Dell PowerFlex Operate Exam Sample Questions (Q104-Q109):

NEW QUESTION # 104

An administrator is preparing to upgrade a PowerFlex cluster. What steps should they follow to ensure success? (Choose two).

- A. Validate hardware compatibility for all nodes
- B. Enable deduplication for all volumes
- C. Verify the cluster health status in PowerFlex Manager
- D. Backup the current cluster configuration

**Answer: C,D**

Explanation:

A successful upgrade relies on a stable starting state and a recovery plan.

\* Verify the cluster health status (Option D): This is the most critical pre-requisite. You must check the PowerFlex Manager dashboard or use the CLI (`scli --query_cluster`) to ensure the system state is

"Optimal." You cannot proceed with an upgrade if the system is in a "Degraded" state or if a Rebuild/Rebalance is currently active, as taking a node offline for upgrade could lead to data unavailability.

\* Backup the current cluster configuration (Option A): In the rare event of a catastrophic failure during the upgrade (e.g., MDM database corruption), having a recent backup of the MDM configuration allows you to restore the cluster map and volume definitions.

#### NEW QUESTION # 105

Shared file systems in PowerFlex allow data sharing across multiple nodes. True or False?

- A. True
- B. False

**Answer: A**

Explanation:

This refers to PowerFlex File (formerly PowerFlex NAS).

While the core PowerFlex product is a block storage solution (providing raw LUNs/Volumes which cannot be safely shared by two standard OS hosts without a cluster file system like VMFS or OCFS2), PowerFlex File introduces NAS nodes. These nodes format the block storage and present it via NFS or SMB protocols. These protocols are specifically designed to allow multiple clients to read and write to the same file system concurrently, enabling true data sharing across the network.

#### NEW QUESTION # 106

What actions are taken when reconfiguring Storage Data Servers during cluster expansion? (Choose two).

- A. Reallocate storage pools for load balancing
- B. Validate new node compatibility with existing SDS configurations
- C. Configure Fault Sets for the new nodes
- D. Enable data deduplication on new SDS nodes

**Answer: B,C**

Explanation:

When expanding a cluster by adding new Storage Data Server (SDS) nodes:

\* Validate new node compatibility (Option A): Before adding a node, you must ensure it matches the hardware compatibility list (HCL). More importantly, to prevent performance bottlenecks ("stragglers"), the new nodes should ideally match the CPU, RAM, and most importantly, the drive type

/performance of the existing nodes in the Storage Pool.

\* Configure Fault Sets for the new nodes (Option C): If the cluster is configured to use Fault Sets (which is recommended for larger clusters to ensure rack-level availability), the new node must be explicitly assigned to a specific Fault Set before it is added. You cannot add a node to a Protection Domain that uses Fault Sets without specifying which Fault Set it belongs to.

Incorrect Options: Option B describes "Rebalance," which is an automatic background process, not a manual "reallocation" action. Option D is incorrect because deduplication is a pool-wide setting; you do not enable it on a per-node basis.

#### NEW QUESTION # 107

Which tasks are automated when configuring snapshots in PowerFlex? (Choose two).

- A. Scheduling snapshot creation
- B. Managing snapshot retention policies
- C. Assigning snapshots to fault sets
- D. Automating snapshot replication

**Answer: A,B**

Explanation:

These tasks are handled by the Snapshot Policy feature in PowerFlex.

Scheduling snapshot creation (Option A): Administrators can define a policy (e.g., "Gold Policy") that triggers a snapshot every 15 minutes. Once applied to a volume, the system automates this trigger.

Managing snapshot retention policies (Option C): The policy also dictates the lifecycle of the snapshot. For example, "Keep 10 hourly snapshots and 5 daily snapshots." As new snapshots are created, the system automatically deletes the oldest ones to free up space and maintain the defined retention count.

### NEW QUESTION # 108

What is the primary function of storage data targets in PowerFlex?

- A. Organize drives for storage pools
- B. Manage metadata for nodes
- C. Provide access to external storage resources
- D. Enable deduplication and compression

**Answer: A**

Explanation:

In PowerFlex terminology, the Storage Data Server (SDS) acts as the "Target" for I/O operations.

\* Organize drives for storage pools (Option B): The SDS takes ownership of the local physical drives (NVMe/SSD/HDD) installed in the server. It aggregates these drives and contributes them to the Storage Pool. It handles the reading and writing of data blocks to this physical media.

Incorrect Options: Metadata is managed by the MDM (A). Access to external resources (C) is not the function of the SDS (which provides internal storage). Deduplication (D) is a specific feature, not the primary function of the component.
