

IT Specialist INF-306 Exam Sample & INF-306 Exam Format

TestkingPDF releases 100% pass-rate IT Specialist INF-306 study guide files which guarantee candidates 100% pass exam in the first attempt. It is time for you to choose a valid IT Specialist INF-306 study guide, this will be your best method for clearing exam and obtain a certification. Good INF-306 Study Guide will be a shortcut for you to well-directed prepare and practice efficiently, you will avoid do much useless efforts and do something interesting.

Our INF-306 study materials are full of useful knowledge, which can meet your requirements of improvement. Also, it just takes about twenty to thirty hours for you to do exercises of the INF-306 study guide. The learning time is short but efficient. You will elevate your ability in the shortest time with the help of our INF-306 Preparation questions. At the same time, you will be bound to pass the exam and achieve the shining INF-306 certification which will help you get a better career.

INF-306 Exam Format - Latest INF-306 Exam Format

You can open the IT Specialist PDF Questions file anywhere and memorize the actual IT Specialist INF-306 test questions. You can install Customer Experience IT Specialist INF-306 pdf dumps on your laptop, tablet, smartphone, or any other device. The Installation method of all these three IT Specialist INF-306 Exam Dumps formats is quite easy. Web-based and desktop INF-306 practice test software creates an actual HTML5 Application Development INF-306 exam environment.

IT Specialist HTML5 Application Development Sample Questions (Q64-Q69):

NEW QUESTION # 64

Review the grid container requirements and mockup on the left. Which markup should you use to define the grid container?

- A. Incorrectly places named area strings under grid-template-rows.
- B. Uses grid-template-columns and grid-template-rows with percentage and pixel sizing.
- C. `.grid-container { display: grid; grid-template-areas: " heading heading heading heading heading heading
" " menu content content content right right " " menu contact contact contact contact " ; grid-gap: 10px; background-color: orange; padding: 10px; }`
- D. Incorrectly places named area strings under grid-template-columns.

Answer: C

NEW QUESTION # 65

Move the appropriate attributes from the list on the left to the correct descriptions on the right. You may use each attribute once, more than once, or not at all.

Note: You will receive partial credit for each correct match.

Attributes	Descriptions
maxlength	Provides a way to set a regular expression that the value must match
multiple	Provides a way to set default text that displays until focus is placed in an element
pattern	Provides a way to set form elements as mandatory
placeholder	Provides a way to allow more than one file or email address in a single input
required	

Answer:

Explanation:

Attributes	Descriptions
maxlength	Provides a way to set a regular expression that the value must match
multiple	Provides a way to set default text that displays until focus is placed in an element
pattern	Provides a way to set form elements as mandatory
placeholder	Provides a way to allow more than one file or email address in a single input
required	

Explanation:

pattern # Provides a way to set a regular expression that the value must match
 placeholder # Provides a way to set default text that displays until focus is placed in an element
 required # Provides a way to set form elements as mandatory
 multiple # Provides a way to allow more than one file or email address in a single input
 The correct matches are based on standard HTML5 form validation and input-attribute behavior. The pattern attribute defines a regular expression that the input value must satisfy before the form can be submitted successfully. It is commonly used for structured values such as phone numbers, codes, postal formats, or custom identifiers. The placeholder attribute supplies short hint text inside an input field, helping the user understand the expected value before entering data. The required attribute makes a form control mandatory; if the field is empty, constraint validation prevents successful submission. The multiple attribute allows a single input to accept more than one value, specifically for controls such as input type= " file " and input type= " email ", where users may upload multiple files or enter multiple email addresses. The maxlength attribute is not used in these matches because it limits the maximum number of characters that can be entered, but none of the listed descriptions asks for character-length restriction. References/topics: HTML5 form attributes, constraint validation, pattern, placeholder, required, multiple, input validation.

NEW QUESTION # 66

You need to create the layout shown, which defines five content areas:

- * Logo and page title
- * Menu
- * Main content area
- * Additional content area
- * Copyright and contact information

You define the following classes:

- A. `.grid-container { display: grid; grid-template-rows: " heading heading heading heading heading heading " " menu content content content right right " " menu contact contact contact contact contact " ; grid-gap: 10px; background-color: orange; padding: 10px; }`
- B. `.grid-container { display: grid; grid-template-columns: " heading heading heading heading heading heading " " menu content content content right right " " menu contact contact contact contact contact " ; grid-gap: 10px; background-color: orange; }`

```
padding: 10px;}
```

- C. `.grid-container { display: grid; grid-template-areas: " heading heading heading heading heading heading
" " menu content content content right right " " menu contact contact contact contact contact "; grid-gap: 10px; background-color: orange; padding: 10px;}`
- D. `.grid-container { display: grid; grid-template-columns: 33% 33% 33%; grid-template-rows: 300px
500px 300px; grid-gap: 10px; background-color: orange; padding: 10px;}`

Answer: C

Explanation:

The correct answer is D because the layout shown is a named-area CSS Grid layout. The mockup contains five semantic regions: the top header area for the logo and page title, a left-side menu, a central main content area, a right-side additional content area, and a bottom copyright/contact area. In CSS Grid, this type of visual structure is defined with `grid-template-areas`, where each quoted string represents one grid row and each repeated name represents how far that area spans across columns. In option D, `heading` spans the full top row, `menu` occupies the left column across the lower rows, `content` fills the main center region, `right` fills the additional content region, and `contact` spans the bottom row to the right of the menu. Option A only defines row and column sizes and does not name the five content areas. Options B and C are invalid for this purpose because named layout strings do not belong in `grid-template-rows` or `grid-template-columns`. References
[/topics: CSS Grid, grid containers, display: grid, named grid areas, grid-template-areas, page layout construction.](#)

NEW QUESTION # 67

You need to define a grid that meets the following requirements:

- * Explicitly sets the width of 6 equal columns of 1 fraction
- * Explicitly sets 5 varied sized rows
- * Defines 15px of space between each grid column
- * Defines 10px between each grid row

Complete the code by selecting the correct option from each drop-down list.

display: grid;

(6, 1fr);

grid-template-rows:
grid-auto-rows:
grid-template-columns:
grid-auto-columns:

repeat
columns
rows
frame

50px 50px 150px 150px 100px;

grid-template-rows:
grid-auto-rows:
grid-template-columns:
grid-auto-columns:

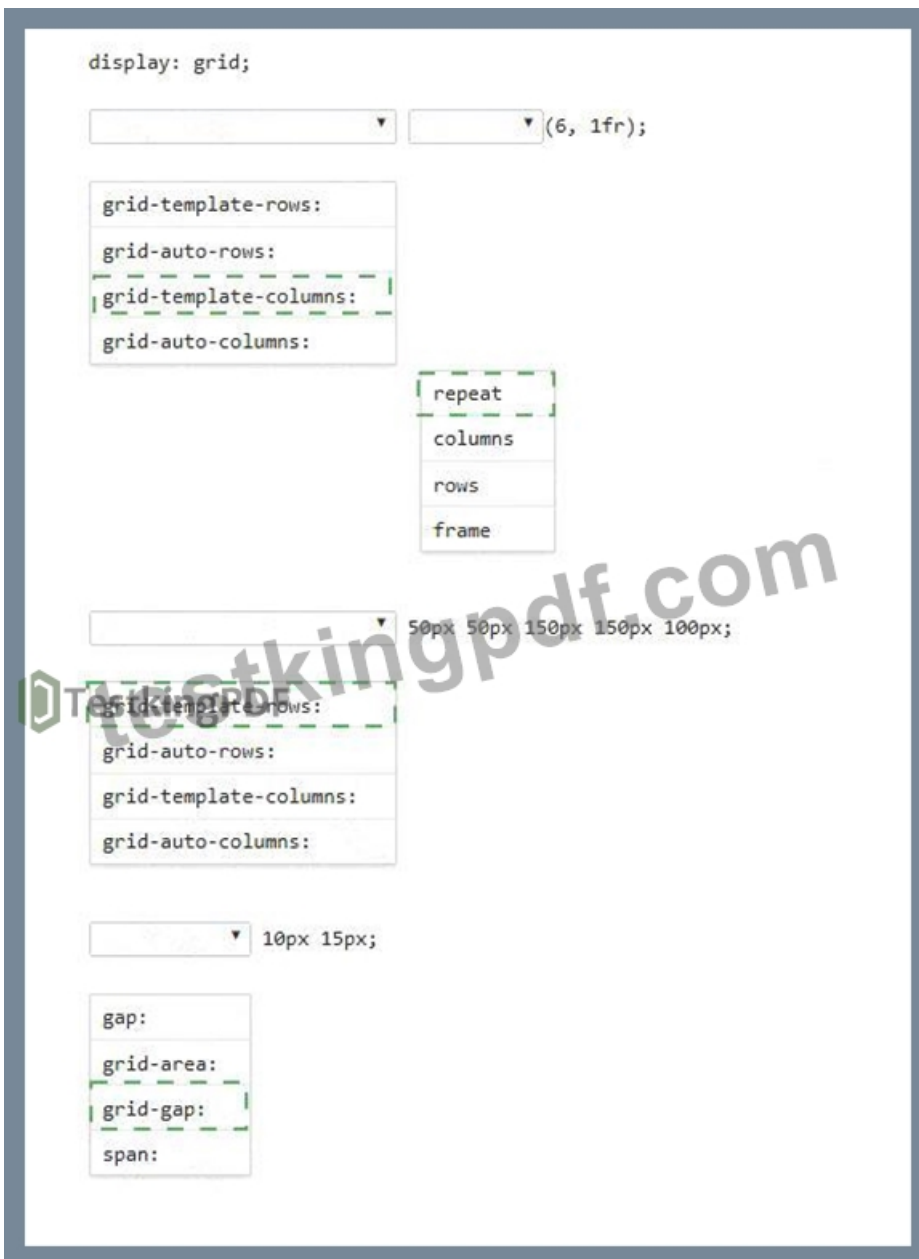

10px 15px;

gap:
grid-area:
grid-gap:
span:

Answer:

Explanation:

Explanation:

`display: grid;`

`grid-template-columns: repeat(6, 1fr);`

`grid-template-rows: 50px 50px 150px 150px 100px;`

`grid-gap: 10px 15px;`

The correct grid definition starts with `display: grid;`, which turns the element into a CSS Grid container. To explicitly create six equal-width columns, the correct property is `grid-template-columns`, and the most efficient value is `repeat(6, 1fr)`. The `repeat()` function avoids writing `1fr` six separate times, while `1fr` assigns each column one equal fraction of the available grid width. The five row sizes must be explicitly declared with `grid-template-rows`, using the exact varied values shown: `50px 50px 150px 150px 100px`. This creates five rows with fixed pixel heights. For the spacing requirement, `grid-gap: 10px 15px;` is the correct shorthand.

The first value controls the row gap, so rows are separated by `10px`; the second value controls the column gap, so columns are separated by `15px`. References/topics: CSS Grid containers, explicit grid tracks, `grid-template-columns`, `grid-template-rows`, `repeat()`, fractional units, grid gaps.

NEW QUESTION # 68

Which two functions support 2D transformations in CSS3? Choose 2.

- A. `move()`
- B. `matrix()`
- C. `scroll()`

- **D. skew()**

Answer: B,D

Explanation:

The correct transformation functions are `matrix()` and `skew()`. CSS transformations are applied with the `transform` property and accept transform functions that alter an element's rendered appearance in two- dimensional or three-dimensional space. MDN defines `< transform-function >` as a data type representing a transformation that can rotate, resize, distort, or move an element in 2D or 3D space. The `matrix()` function is valid because it defines a homogeneous two-dimensional transformation matrix, allowing translation, scaling, rotation, and skewing effects to be represented numerically in one function. The `skew()` function is also valid because it explicitly skews an element on the 2D plane. `scroll()` is not a CSS transform function; scrolling is handled through overflow behavior or scrolling APIs. `move()` is also not a valid CSS transform function; the standard transform function for movement is `translate()`. References/topics: CSS3 transforms, transform property, 2D transformation functions, `matrix()`, `skew()`.

NEW QUESTION # 69

.....

Our web-based practice test is accessible from anywhere with an internet connection, which means you can take it at your convenience. This IT Specialist INF-306 Practice Test is designed to simulate the actual exam and help you become familiar with the test format. You can access the web-based practice exam from anywhere with an internet connection to study on the go or from the comfort of your own home. You can receive your mock exam result instantly.
