As a customer you will want to choose low-price and high-passing rate products. Sometime it seems paradoxical. But now our CrowdStrike CCCS-203b exam questions vce will be a nice choice. If you care about price, there are many companies lower than us, if you care about passing rate I am sure there is little companies higher than us. Our CCCS-203b Exam Questions Vce highlight the quality and value for money; it is really worth to buy in this field.

CrowdStrike CCCS-203b Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"> Findings and Detection Analysis: This domain covers evaluating security controls to identify IOMs, vulnerabilities, suspicious activity, and persistence mechanisms, auditing user permissions, comparing configurations to benchmarks, and discovering unmanaged public-facing assets.
Topic 2	<ul style="list-style-type: none"> Cloud Security Policies and Rules: This domain addresses configuring CSPM policies, image assessment policies, Kubernetes admission controller policies, and runtime sensor policies based on specific use cases.
Topic 3	<ul style="list-style-type: none"> Pre-Runtime Protection: This domain covers managing registry connections, selecting image assessment methods, and analyzing assessment reports to identify malware, CVEs, leaked secrets, Dockerfile misconfigurations, and vulnerabilities before deployment.
Topic 4	<ul style="list-style-type: none"> Runtime Protection: This domain focuses on selecting appropriate Falcon sensors for Kubernetes environments, troubleshooting deployments, and identifying misconfigurations, unassessed images, IOAs, rogue containers, drift, and network connections.
Topic 5	<ul style="list-style-type: none"> Cloud Account Registration: This domain focuses on selecting secure registration methods for cloud environments, understanding required roles, organizing resources into cloud groups, configuring scan exclusions, and troubleshooting registration issues.

CrowdStrike Certified Cloud Specialist Sample Questions (Q61-Q66):

NEW QUESTION # 61

Which of the following best describes a "cloud service misconfiguration" in the context of Falcon Cloud Security?

- A. Failing to enable multi-factor authentication for all user accounts
- B. Allowing outbound network traffic from a containerized application
- C. Exposing sensitive data through misconfigured AWS S3 bucket permissions
- D. Running an outdated operating system on a virtual machine

Answer: C

Explanation:

Option A: This is incorrect because allowing outbound traffic might be a security consideration but is not inherently a misconfiguration. It depends on the context and the specific security policies in place.

Option B: This is incorrect because, while enabling MFA is a critical security practice, it pertains to identity and access management (IAM) policies rather than a cloud service misconfiguration.

Option C: This is correct because a misconfigured AWS S3 bucket is a classic example of a cloud service misconfiguration. Falcon Cloud Security identifies and alerts on such misconfigurations to prevent potential data breaches and compliance violations.

Option D: This is incorrect because this is an example of poor patch management or system maintenance, not a cloud service misconfiguration. Falcon Spotlight might identify such vulnerabilities, but they are not classified under "cloud service misconfiguration."

NEW QUESTION # 62

Which of the following is a correct example of using automated remediation in the CrowdStrike Falcon platform to address a cloud-related security incident?

- A. Notifying an administrator to review suspicious activity manually
- B. Quarantining a compromised virtual machine automatically upon detection of malware
- C. Disabling unused user accounts in the cloud environment weekly
- D. Sending compliance violation logs to a third-party monitoring system

Answer: B

Explanation:

Option A: This action is an example of a maintenance task, not automated remediation.

Automated remediation focuses on dynamic responses to detected threats or incidents rather than routine administrative tasks.

Option B: This action is part of logging and monitoring, not remediation. Automated remediation involves direct actions to mitigate or eliminate threats rather than just reporting or logging violations.

Option C: Automated remediation in the CrowdStrike Falcon platform includes the ability to isolate or quarantine compromised resources, such as virtual machines, to prevent further spread of malware or threats. This action happens automatically based on predefined policies and is a hallmark of automated remediation. It ensures immediate containment without waiting for manual intervention.

Option D: While notification is an essential part of incident response, it is not an example of automated remediation. Automated remediation involves taking direct action, such as isolating or removing a threat, rather than relying on manual review or follow-up.

NEW QUESTION # 63

How does CrowdStrike's Application Security Posture Management (ASPM) enhance container security?

- A. By enforcing MFA on cloud users
- B. By scanning deployed pods
- C. By deploying agentless runtime protection
- D. By identifying and fixing insecure configurations in code before deployment

Answer: D

NEW QUESTION # 64

An enterprise using Kubernetes wants to enforce a security policy that ensures all deployed containers originate only from their private container registry (registry.example.com). What is the best way to achieve this using an admission controller?

- A. Use a ValidatingWebhookConfiguration to reject pods that use images from untrusted registries
- B. Use RBAC to restrict users from pulling images from unauthorized registries
- C. Use a PodSecurityPolicy (PSP) to define allowed image sources
- D. Use a Kubernetes NetworkPolicy to restrict egress traffic to public container registries

Answer: A

Explanation:

Option A: NetworkPolicies do not control which images can be pulled, only how network traffic flows between pods. Attackers could still use unauthorized images that were already pulled and cached.

Option B: PodSecurityPolicies (PSPs) are deprecated and cannot enforce image sources. Even when PSPs were in use, they did not provide controls for restricting container images based on registries.

Option C: RBAC rules control permissions related to Kubernetes objects but do not directly prevent the use of unauthorized container images.

Option D: A ValidatingWebhookConfiguration can be set up to inspect pod specifications and deny any that use images not sourced from registry.example.com. This provides a centralized and enforceable policy.

NEW QUESTION # 65

Which of the following best describes the benefits of Falcon Cloud Security in securing cloud workloads and how its components work together?

- A. Falcon Cloud Security requires third-party integrations to achieve workload protection in hybrid environments.
- B. Falcon Cloud Security is limited to monitoring and alerting and does not actively prevent threats in cloud environments.
- C. Falcon Cloud Security offers endpoint detection and response (EDR) solutions that operate only within on-premises environments, ensuring data is never sent to the cloud.
- D. Falcon Cloud Security provides real-time threat detection, policy enforcement, and workload protection across multi-cloud environments, integrating seamlessly with other Falcon modules.

Answer: D

Explanation:

Option A: Falcon Cloud Security is a cloud-native solution, not confined to on-premises environments. It leverages cloud-based analytics to provide protection for workloads in multi- cloud, hybrid, and on-premises setups. This answer misconstrues Falcon's cloud capabilities by focusing solely on on-premises environments.

Option B: Falcon Cloud Security does not rely solely on third-party integrations for hybrid cloud protection. It is built to function

effectively across hybrid environments with native capabilities, although it can augment security with integrations if desired.

Option C: Falcon Cloud Security delivers comprehensive protection by offering real-time threat detection, policy enforcement, and workload protection across multi-cloud setups (e.g., AWS, Azure, GCP). It integrates seamlessly with other CrowdStrike modules, such as Falcon Insight (EDR) and Falcon Discover, creating a unified security approach.

Option D: While Falcon Cloud Security provides monitoring and alerting, it also actively prevents threats using advanced AI and behavioral analysis. The claim that it is limited to monitoring overlooks its preventative measures and proactive threat-hunting capabilities.
