dbt Labs dbt Analytics Engineering Certification Exam Sample Questions

(Q234-Q239):

NEW QUESTION # 234

Examine the code:

```
select
left(customers.id, 12) as customer_id,
customers.name as customer_name,
case when employees.employee_id is not null then true else false end as is_employee, event_signups.event_name,
event_signups.event_date, sum(case when visit_accomodations.type = 'hotel' then 1 end)::boolean as booked_hotel, sum(case when
visit_accomodations.type = 'car' then 1 end)::boolean as booked_ride from customers
-- one customer can sign up for many events
left join event_signups
on left(customers.id, 12) = event_signups.customer_id
-- an event signup for a single customer can have many types of accommodations booked left join visit_accomodations on
event_signups.signup_id = visit_accomodations.signup_id and left(customers.id, 12) = visit_accomodations.customer_id
-- an employee can be a customer
left join employees
on left(customers.id, 12) = employees.customer_id
group by 1, 2
```

Answer:

Explanation:

Explanation:

Operation

Correct Location

Aggregations (booked_hotel, booked_ride)

In a model dedicated to pre-aggregate data for reporting

Standardizing customer_id

In the first layer of models

Selecting customer_name

In the first layer of models

Joining employees

In a model between the first layer and final layer of models

In dbt's recommended modeling framework, transformations should be centralized according to their purpose and level of abstraction. Basic cleaning and column standardization-such as shortening customers.id using left(customers.id, 12)-belongs in the first layer of models, commonly known as staging models. This layer is responsible for producing clean, consistent, analytics-ready fields. Selecting raw descriptive fields like customers.name also belongs in this layer.

Joins that enrich a dataset by combining cleaned staging outputs across domains-such as joining customers with employees-belong in intermediate models. These models unify business logic that sits between the raw staging layer and the final aggregations used for reporting.

Finally, aggregations like counting types of accommodations (booked_hotel and booked_ride) belong in marts or reporting models, especially when they involve summarization that downstream tools (dashboards, BI reports) will consume. This keeps heavy business logic centralized and reusable.

NEW QUESTION # 235

A user reports a critical security issue discovered in a third-party dbt package you use. Where could you most likely find updated information about potential vulnerabilities or fixes?

- A. Within dbt Cloud's central package documentation and release notes.
- B. The packages.yml file in your dbt project.
- C. The locally generated dbt documentation for the installed packages.
- **D. Directly from the maintainer of the dbt package, often in a GitHub repository or similar**

Answer: D

Explanation:

Package maintainers are the primary source of truth- However, options like A and C might provide additional resources:A. Your packages.yml might help identify the package C: dbt Cloud might aggregate some vulnerability information.

NEW QUESTION # 236

You need to override a source description at the model level. How would you achieve this most effectively?

- A. Use the meta configuration in your model file to provide an alternative description.
- B. You cannot override a source description directly in the model.
- C. Create a separate column in the source with a model-specific description.
- D. Utilize a Jinja macro to dynamically construct the description based on specific conditions.

Answer: A

Explanation:

The meta configuration can be used to override source descriptions and other metadata at the model level. However, make sure to check the documentation for your specific dbt version, as the exact way to do this might vary_

NEW QUESTION # 237

You've been tasked with customizing the appearance of the generated documentation. Which of the following would be the most efficient starting point?

- A. Search for third-party dbt packages designed for documentation customization.
- B. Write a macro that programmatically generates a new documentation structure based on your requirements_
- C. Investigate overriding the default CSS and JavaScript files used by the documentation site.
- D. Edit the json files created during the dbt docs generate process to adjust the display of information.

Answer: A,C

Explanation:

A: Overriding the CSS and potentially JavaScript provides customization flexibility without completely rebuilding the documentation structure. D: Extending dbt's functionality with packages often offers pre-built solutions for more extensive customization of the documentation site.

NEW QUESTION # 238

Which two configuration items can be defined under models: in your dbt_project.yml file?

Choose 2 options.

- A. test
- B. tags
- C. schema
- D. source
- E. target

Answer: B,C

Explanation:

The correct answers are A: schema and C: tags.

In dbt, the dbt_project.yml file is the central configuration file that defines model-level settings. Under the models: section, you can specify a wide range of model configurations such as schema, materialized, tags, alias, and custom meta fields. The schema configuration allows you to control which database schema a model should be built in, giving analytics engineers the flexibility to organize models by domain or environment. The tags configuration is also valid under models: and is widely used to group models logically for selection, documentation, or orchestration workflows.

Option B (source) is incorrect because sources are defined under YAML files in the sources: section, not under models: in dbt_project.yml. Option D (test) is incorrect because tests must be defined in model or source YAML files, not inside the project configuration. Option E (target) is not a configuration that applies to models; rather, it refers to dbt runtime environments and cannot be configured under the models: block.

dbt's project configuration system ensures that model-level behavior is managed centrally and consistently, and schema and tags are two of the officially supported configuration keys under models:.
