Amazon AWS Certified Solutions Architect - Associate (SAA-C03) Sample Questions (Q11-Q16):

NEW QUESTION # 11

A web company is looking to implement an intrusion detection and prevention system into their deployed VPC. This platform should have the ability to scale to thousands of instances running inside of the VPC, How should they architect their solution to achieve these goals?

- A. Configure an instance with monitoring software and the elastic network interface (ENI) set to promiscuous mode packet sniffing to see an traffic across the VPC,
- B. Configure each host with an agent that collects all network traffic and sends that traffic to the IDS/IPS platform for inspection.
- C. Create a second VPC and route all traffic from the primary application VPC through the second VPC where the scalable virtualized IDS/IPS platform resides.
- D. Configure servers running in the VPC using the host-based 'route' commands to send all traffic through the platform to a scalable virtualized IDS/IPS.

Answer: D

NEW QUESTION # 12

Question:

A genomics research company is designing a scalable architecture for a loosely coupled workload. Tasks in the workload are independent and can be processed in parallel. The architecture needs to minimize management overhead and provide automatic scaling based on demand.

Options:

- A. Implement vertical scaling for each workload task.
- B. Implement a serverless architecture that uses AWS Lambda functions.
- C. Use a cluster of Amazon EC2 instances. Use AWS Systems Manager to manage the workload.
- D. Use AWS ParallelCluster to deploy a dedicated high-performance cluster.

Answer: B

Explanation:

Comprehensive and Detailed Explanation:

For workloads where tasks are independent and can be processed in parallel, and where minimizing management overhead is a priority, a serverless architecture using AWS Lambda is ideal.

* AWS Lambda allows you to run code without provisioning or managing servers. It automatically scales your application by running code in response to each trigger.

* Parallel Processing: Lambda functions can process multiple tasks concurrently, making it suitable for parallel workloads.

* Automatic Scaling: Lambda automatically scales by running code in response to each event, scaling precisely with the size of the workload.

* Minimal Management Overhead: With Lambda, there's no need to manage the underlying infrastructure, reducing operational complexity. Wikipedia References:

NEW QUESTION # 14

An application stack includes an Elastic Load Balancer in a public subnet, a fleet of Amazon EC2 instances in an Auto Scaling group, and an Amazon RDS MySQL cluster. Users connect to the application from the Internet. The application servers and database must be secure.

How should a Solutions Architect perform this task?

- A. Create a public subnet for the Amazon EC2 instances and a private subnet for the Amazon RDS cluster.
- B. Create a public subnet for the Amazon EC2 instances and a public subnet for the Amazon RDS cluster.
- C. Create a private subnet for the Amazon EC2 instances and a public subnet for the Amazon RDS cluster.
- **D. Create a private subnet for the Amazon EC2 instances and a private subnet for the Amazon RDS cluster.**

NEW QUESTION # 15

A company hosts a multi-tier web application that uses an Amazon Aurora MySQL DB cluster for storage.

The application tier is hosted on Amazon EC2 instances. The company's IT security guidelines mandate that the database credentials be encrypted and rotated every 14 days. What should a solutions architect do to meet this requirement with the LEAST operational effort?

- **A. Create a new AWS Key Management Service (AWS KMS) encryption key. Use AWS Secrets Manager to create a new secret that uses the KMS key with the appropriate credentials. Associate the secret with the Aurora DB cluster. Configure a custom rotation period of 14 days.**
- B. Store a file that contains the credentials in an AWS Key Management Service (AWS KMS) encrypted Amazon Elastic File System (Amazon EFS) file system. Mount the EFS file system in all EC2 instances of the application tier. Restrict the access to the file on the file system so that the application can read the file and that only super users can modify the file. Implement an AWS Lambda function that rotates the key in Aurora every 14 days and writes new credentials into the file.
- C. Store a file that contains the credentials in an AWS Key Management Service (AWS KMS) encrypted Amazon S3 bucket that the application uses to load the credentials. Download the file to the application regularly to ensure that the correct credentials are used. Implement an AWS Lambda function that rotates the Aurora credentials every 14 days and uploads these credentials to the file in the S3 bucket.
- D. Create two parameters in AWS Systems Manager Parameter Store: one for the user name as a string parameter and one that uses the SecureString type for the password. Select AWS Key Management Service (AWS KMS) encryption for the password parameter, and load these parameters in the application tier. Implement an AWS Lambda function that rotates the password every 14 days.
