NEW QUESTION # 199

Within the playbook editor, which function allows a user to associate a task output to an incident field?.

- A. Mapping.
- B. Inputs.
- C. Classification.
- **D. Extend context.**

Answer: D

Explanation:

The XSOAR Playbook Editor allows engineers to manipulate and transform context data dynamically.

According to the XSOAR Admin and Playbook Development Guides, "Extend Context" is the dedicated mechanism that enables a task to save output values into new or existing context keys, including keys that correspond to incident fields. By defining a key under the "Extend Context" section, the playbook task can map specific outputs—such as JSON fields, strings, arrays, or nested objects—to a structured location within the incident context. These keys can then be used to populate incident fields through further playbook tasks, field mappings, or automated incident field updates.

Classification (option A) applies only during ingestion and cannot assign task outputs to incident fields. Inputs (option B) define what data a task receives, not how it is stored afterward. Mapping (option D) belongs to the ingestion pipeline and determines how event fields become incident fields during creation, not during playbook execution.

Therefore, Extend Context is the correct feature that allows a task to associate its output with incident fields, making option C the correct answer based on documentation.

NEW QUESTION # 200

When the "Only allow these dashboards" checkbox is selected for a user role, what is the primary effect on users assigned this role?

- A. They will be restricted to viewing only the specified default dashboards and cannot make any modifications.
- B. They are prompted to select their preferred dashboards upon login and can only modify these chosen dashboards.
- C. They will automatically have all dashboards that are shared with them added to their view.
- D. They can only view specified dashboards and make minor modifications.

Answer: A

Explanation:

The XSOAR RBAC documentation states that role-based permissions can restrict user access to dashboards.

When the administrator selects "Only allow these dashboards" within a role, the platform enforces a strict limitation: users assigned to this role can view only the dashboards explicitly listed in the role configuration.

These dashboards become their default and sole available dashboards. They cannot create new dashboards, modify existing ones, delete dashboards, or access any dashboard not included in the allowed list. This setting is typically used in regulated environments or SOC tiers where dashboard visibility must align with job function and least-privilege principles.

The documentation clarifies that this permission setting removes access to any dashboards not included, overriding normal dashboard-sharing behavior. Therefore, options suggesting the user can modify dashboards (A or B) or automatically gain access to shared dashboards (C) contradict RBAC restrictions. The correct behavior is complete restriction: users can only view the explicitly authorized dashboards, with no ability to modify them. Thus, option D reflects the exact enforced behavior per XSOAR's role permissions model.

NEW QUESTION # 201
