## HPE Campus Access Switching Expert Written Exam Sample Questions (Q118-Q123):

### NEW QUESTION # 118

What is the correct sequence of events that occurs when a user device connects to a network using Dynamic Segmentation?

**Answer:**

Explanation:

Explanation:

This question asks for the sequence of events when a user device connects to a network utilizing Dynamic Segmentation, which typically involves authentication via ClearPass and role-based policy assignment.

\* Authentication: When a device connects (wired or wireless), the first step in gaining secure access is authentication. The switch or AP (authenticator) facilitates this process, usually communicating via RADIUS with ClearPass Policy Manager (RADIUS server). The device provides credentials or uses certificates (e.g., 802.1X, MAC Auth).

\* Role Assignment: Upon successful authentication, ClearPass evaluates policies based on the device /user context (identity, posture, time of day, etc.) and sends back RADIUS attributes to the authenticator. A crucial attribute is the assigned User Role. This role encapsulates the access privileges and network configuration for the device.

\* Network Placement/Segmentation: The authenticator (switch/AP) uses the assigned role information received from ClearPass to place the device into the appropriate network segment. This might involve assigning a specific VLAN ID to the port/client or, in User-Based Tunneling (UBT) scenarios, establishing a tunnel to an Aruba Gateway associated with that role. The step "placed on a VLAN based on its role" describes one common method of segmentation based on the assigned role.

\* Access Granted: Once the device is authenticated, assigned a role, and placed in the correct network segment (VLAN or tunnel), access is granted according to the firewall rules, QoS settings, and other policies defined within that assigned role. Traffic can now flow subject to these enforced policies.

References: Aruba Dynamic Segmentation Solution Guides, ClearPass Policy Manager Documentation, AOS- CX Security Guide (Roles, Port Access). This relates to "Authentication/Authorization" (9%), "Security" (10%), "Switching" (19%), and "WLAN" (9%) objectives.

### NEW QUESTION # 119

A customer has set a requirement for VLAN 151 to be an isolated VLAN. A colleague has copied and pasted a partial configuration, but you do not achieve the desired outcome.

This is the code that was added:

What should be added to the configuration before this code to achieve the desired result?

- A.
- B.
- C.
- D.

### Answer: B

Explanation:

To configure VLAN 151 as an isolated VLAN, you first need to define VLAN 15 as the primary VLAN. The correct syntax is private-vlan primary, as shown in image 4. Once VLAN 15 is defined as primary, VLAN 151 can be configured as an isolated VLAN under VLAN 151 with private-vlan isolated primary-vlan 15.

### NEW QUESTION # 120

You are configuring an SSID that is using PSK as a security mechanism. Why should you use WPA3- Personal with WPA3 Transition Mode disabled?

- A. WPA3-Personal with Transition Mode disabled should be used to prevent legacy clients from connecting to the network.
- B. WPA3-Personal with Transition Mode disabled is optional for 6 GHz-enabled networks as there is a built-in fallback to 6 GHz mode with WPA2
- C. WPA3-Personal with Transition Mode disabled is mandatory for 5 GHz-enabled networks.
- D. **WPA3-Personal with Transition Mode disabled is mandatory for 6 GHz-enabled networks.**

### Answer: D

### NEW QUESTION # 121

The user's device is failing 802.1X with EAP-TLS authentication. We know that the client-side certificate is valid. What is the likely cause of this issue? (Choose two.)

- A. The user's device is not configured to use the correct gateway.
- B. The NAD is not able to communicate with DNS servers.
- C. **There is an EAP-type mismatch.**
- D. **There is a problem with the ACL applied to the switch port.**
- E. The user's device is using the wrong MAC address.

## Answer: C,D

Explanation:

A restrictive ACL on the switch port can block required authentication or EAP traffic, causing 802.1X failure.

An EAP-type mismatch between client and network (for example, if the switch or RADIUS is not configured for EAP-TLS) will also cause authentication to fail, even if the certificate is valid.

## NEW QUESTION # 122

An engineer finds that a specific HPE switch interface has high error rates. Which two parameters are most likely causing this issue?

- A. LACP mode
- B. VLAN misconfiguration
- C. Port speed
- D. Duplex mismatch

## Answer: C,D

## NEW QUESTION # 123
