Reliable Plat-Dev-301 Exam Vce - Your Sharpest Sword to Pass Salesforce Certified Platform Developer II - Multiple Choice

Our Plat-Dev-301 Test Guide is suitable for you whichever level you are in right now. Whether you are in entry-level position or experienced exam candidates who have tried the exam before, this is the perfect chance to give a shot. Not only from precious experience about the exam but the newest information within them. Our Salesforce Certified Platform Developer II - Multiple Choice study question will be a valuable investment with reasonable prices. Besides, they can be obtained within 5 minutes if you make up your mind.

Salesforce Certified Platform Developer II - Multiple Choice Sample Questions (Q188-Q193):

NEW QUESTION # 188

A Visualforce page needs to make a callout to get billing information and tax information from two different REST endpoints. The information needs to be displayed to the user at the same time and the return value of the billing information contains the input for the tax information callout. Each endpoint might take up to two minutes to process. How should a developer implement the callouts?

- A. An HTTP REST callout for the billing callout and a Continuation for the tax callout
- B. A Continuation for the billing callout and an HTTP REST callout for the tax callout
- **C. A Continuation for both the billing callout and the tax callout**
- D. An HTTP REST callout for both the billing callout and the tax callout

Answer: C

Explanation:

Using Continuation for both callouts is the optimal solution when you have long-running callouts in a Visualforce page, as it allows the page to wait for a long-running process without tying up server resources. The Continuation pattern is specifically designed for scenarios where the request-response cycle could exceed the timeout limits.

NEW QUESTION # 189

Consider the Apex controller below, that is called from an Aura component.

```

Line 1 public class AttributeTypes
Line 2 {
Line 3     private final String[] arrayItems;
Line 4
Line 5     @AuraEnabled
Line 6     public List<String> getStringArray() {
Line 7         String[] arrayItems = new String[] { 'red', 'green',
Line 8         'blue' };
Line 9         return arrayItems;
Line 10     }

```

What is wrong with this code?

- A. Line 8: method must first serialize the list to JSON before returning
- B. Line 6: method must be static
- C. Line 1: class must be global
- D. Lines 1 and 6: class and method must be global

Answer: A

Explanation:

The method defined in the Apex class must be static to be used as an Aura-enabled method. Aura-enabled methods need to be static because they are called by the Lightning framework without instantiating the class.

NEW QUESTION # 190

Universal Containers (LIC) wants to develop a customer community to help their customers log issues with their containers. The community needs to function for their German- and Spanish-speaking customers also. UC heard that it's easy to create an international community using Salesforce, and hired a developer to build out the site.

What should the developer use to ensure the site is multilingual?

- A. Use custom objects to translate custom picklist values.
- B. Use custom metadata to translate custom picklist values.
- C. Use custom settings to ensure custom messages are translated properly.
- D. Use custom labels to ensure custom messages are translated properly.

Answer: D

Explanation:

Custom labels are used for translating text strings in Salesforce that need to be presented in multiple languages. They support translations and can be referenced in Aura components, Visualforce pages, and Apex code.

NEW QUESTION # 191

A company wants to incorporate a third-party web service to set the Address fields when an Account is inserted, if they have not already been set.

What is the optimal way to achieve this?

- A. Create an Apex trigger, execute a Queueable job from it, and make a callout from the Queueable job.
- B. Create a Before Save Flow, execute a Queueable job from it, and make a callout from the Queueable job.
- C. Create a Process, execute a Queueable job from it, and make a callout from the Queueable job.
- D. Create a Workflow Rule, execute a Queueable job from it, and make a callout from the Queueable job.

Answer: A

Explanation:

To make a callout to set the Address fields when an Account is inserted without violating the Salesforce limit against callouts from triggers, a developer can use a trigger to execute a Queueable job. The Queueable job can then safely make the callout.

NEW QUESTION # 192

Which technique can run custom logic when a Lightning web component is loaded?

- A. Use the `connectedCallback {}` method.
- B. Use an `<aura:handler>` init event to call a function.
- C. Call `$.enqueueAction` and pass in the method to call.
- D. Use the `renderedCallback {}` method.

Answer: A

Explanation:

The `connectedCallback()` lifecycle hook in Lightning Web Components (LWC) is used to perform logic after a component is inserted into the DOM, making it the ideal place to execute custom logic when the component is loaded.

NEW QUESTION # 193

.....

If you prefer to prepare for your Plat-Dev-301 exam on paper, we will be your best choice. Plat-Dev-301 PDF version is printable, and you can print them into hard one and take some notes on them if you like, and you can study them anytime and anywhere. In addition, Plat-Dev-301 Pdf Version have free demo for you to have a try, so that you can have deeper understanding of what you are going to buy. Plat-Dev-301 exam dumps are edited by skilled experts, and therefore the quality can be guaranteed. And you can use them at ease.
