Cisco Certified Support Technician (CCST) Cybersecurity Sample Questions (Q289-Q294):

NEW QUESTION # 289

How does sandboxing help with the analysis of malware?

- A. It allows suspicious applications to run in a safe and isolated testing environment.
- B. It specifies the applications that are authorized for use on the network.
- C. It restricts traffic from passing from one network to another.
- D. It defines the suspicious or malicious applications that should be blocked.

Answer: A

Explanation:

The CCST Cybersecurity Study Guide explains that sandboxing is a security technique that executes suspicious programs in a controlled and isolated environment, preventing them from affecting production systems while enabling behavior analysis.

"Sandboxing isolates a suspected application in a secure, controlled environment where it can be executed and analyzed without risking damage to the host system or network." (CCST Cybersecurity, Endpoint Security Concepts, Malware Analysis Techniques section, Cisco Networking Academy)

NEW QUESTION # 290

What is the purpose of a disaster recovery plan (DRP)?

- A. To outline procedures and strategies for recovering critical systems and data after a disaster
- B. To regularly test the effectiveness of backup systems and processes
- C. To prevent the occurrence of disasters or disruptive events
- D. To provide a secondary data storage location for backup purposes

Answer: A

Explanation:

A disaster recovery plan (DRP) is a documented set of procedures and strategies designed to guide an organization during the recovery process after a disaster or disruptive event has occurred. It encompasses the recovery of critical systems, applications, and data to ensure continuity of operations.

NEW QUESTION # 291

Which type of encryption algorithm uses two different keys: a public key for encryption and a private key for decryption?

- A. Asymmetric encryption
- B. HMAC algorithm
- C. Symmetric encryption
- D. Hashing algorithm

Answer: A

Explanation:

Asymmetric encryption, also known as public-key encryption, uses a pair of keys: a public key and a private key. The public key is used for encryption, while the private key is used for decryption. This allows for secure communication over an insecure channel, as the public key can be shared freely without compromising the security of the message.

NEW QUESTION # 292

Which of the following refers to a list of all hardware components installed on an endpoint system?

- A. Firmware inventory
- B. Software inventory
- **C. Hardware inventory**
- D. Configuration inventory

Answer: C

Explanation:

Hardware inventory refers to a comprehensive list of all hardware components installed on an endpoint system. This includes information about the CPU, memory, storage devices, network adapters, and any other hardware components.

NEW QUESTION # 293

Which of the following techniques is commonly used for monitoring security events "as they occur"?

- **A. Intrusion detection systems (IDS)**
- B. Firewall configuration
- C. Access control lists (ACL)
- D. Vulnerability scanning

Answer: A

Explanation:

Intrusion detection systems (IDS) are commonly used for monitoring security events in real-time. IDS monitors network traffic and system activity, looking for signs of unauthorized access, malicious activities, or anomalous behavior. When an intrusion is detected, the system generates alerts for immediate action and response.
