## 최신 Pure Storage FAIS FlashArray-Implementation-Specialist 무료 샘플문제 (Q45-Q50):

### 질문 # 45

What command can be used to identify interface status?

- A. purenetwork list --all
- B. purenetwork list
- C. purenetwork list --eth

정답: B

#### 설명:

The command purenetwork list is used to identify the configuration and status of the array's logical network interfaces.

Command Output: Running purenetwork list provides a tabular view of all configured IP interfaces (Management, iSCSI, Replication). Critical columns in this output include:

Name: (e.g., vir0, eth0, eth1)

Address/Netmask: The IP configuration.

Gateway: Routing information.

Status: (e.g., "enabled" or "disabled").

Usage: An Implementation Engineer uses this command to verify that the management VIP and physical interfaces are correctly configured and legally "up" (enabled) in the Purity software stack.

Distinctions: While purehw list is used for physical hardware link status (e.g., cable plugged in/link light), purenetwork is the primary namespace for IP-level validation. Options B and C (--all, --eth) are not the primary standard syntax for the general status view in this specific context; the base command provides the necessary summary data for initial verification.

### 질문 # 46

A customer would like to reduce SafeMode settings for retention and eradication with their current policy.

How is authorization obtained to make the requested changes?

- A. Two SafeMode approvers need to acknowledge via Pure1 step-up authentication before any changes can be made.
- B. The local account on FlashArray needs to permit any local changes.
- C. A Pure1 Admin needs to approve any changes for Pure Support to proceed.

정답: A

#### 설명:

Reducing SafeMode retention and eradication settings requires approval from two designated SafeMode approvers via Pure1's step-up authentication to ensure secure and authorized policy changes.

#### 질문 # 47

An Implementation Engineer is upgrading a FlashArray//X50R3 to an //X50R4. The array has 10 SAS and 10 DirectFlash modules in the chassis. What type of controller is required to complete the upgrade?

- A. FLASHARRAY//XC50 R4, NS
- **B. FLASHARRAY//XC50 R4**
- C. FLASHARRAY//XC50 R4, SE

**정답: B**

**설명:**

When performing a controller upgrade (Non-Disruptive Upgrade) from an //X50R3 to an //X50R4, the specific hardware configuration of the source array dictates the target bill of materials. The presence of SAS drives in the chassis indicates that the source is a legacy or transitional configuration, as the standard //X R4 platform is optimized for end-to-end NVMe (DirectFlash). However, the question asks for the specific controller SKU required. In Pure Storage nomenclature for upgrades, the standard controller replacement part is typically the base model code, here FLASHARRAY//XC50 R4.

The "XC" designation often refers to the controller component itself in upgrade kits. While special considerations apply to SAS media (which are usually phased out or require specific handling during R4 upgrades since R4 natively drops legacy SAS support on the motherboard), the controller part number itself remains the standard R4 SKU (Option C). Options like "SE" or "NS" (often denoting specific encryption or networking variants) are not the standard identifiers for the base controller upgrade in this context.

#### 질문 # 48

Before installing array rails, where should the cage nuts be placed?

- A. Lowest square of top RU
- **B. Lowest square of lowest RU**
- C. Top square of the lowest RU

**정답: B**

**설명:**

Cage nuts should be placed in the lowest square hole of the lowest rack unit (RU) where the array rails will be installed to ensure proper alignment and support.

#### 질문 # 49

What is the required PSU wattage for a FlashArray// X70R2/R3 or X90R2/R3 array?

- A. 1300W
- B. 1200W
- **C. 1600W**

**정답: C**

**설명:**

The FlashArray//X70 (R2/R3) and FlashArray//X90 (R2/R3) require 1600W Power Supply Units (PSUs) .

Pure Storage equips its FlashArray//X chassis with different power supply capacities based on the compute load of the installed controllers:

\* Performance Tier (X70/X90): These models utilize high-core-count Intel Xeon processors and support the maximum density of NVMe DirectFlash Modules. To support the peak power draw of these components while maintaining N+1 redundancy (where one PSU can support the entire load), the 1600W units are mandatory.

\* Entry/Mid Tier (X10/X20/X50): Lower-end models often ship with 1000W or 1200W PSUs (though X50 often uses 1600W in later revisions or specific configs).

\* Identification: Implementation Engineers can identify these PSUs by the label on the rear handle (often color-coded or explicitly marked "1600W"). Installing an X90 controller into a chassis with older 1200W PSUs (e.g., during an improper upgrade attempt) would likely trigger a hardware alert or prevent the controllers from booting due to insufficient power budget.
