Amazon AWS Certified Solutions Architect - Associate (SAA-C03) Sample Questions (Q91-Q96):

NEW QUESTION # 91
What does the following command do with respect to the Amazon EC2 security groups? ec2-create-group CreateSecurityGroup

- A. Groups the user created security groups in to a new group for easy access.
- B. Creates a new rule inside the security group.
- C. Creates a new security group for use with your account.
- D. Creates a new group inside the security group.

Answer: C

NEW QUESTION # 92
A company has launched an Amazon RDS for MySQL D6 instance Most of the connections to the database come from serverless applications. Application traffic to the database changes significantly at random intervals At limes of high demand, users report that their applications experience database connection rejection errors.
Which solution will resolve this issue with the LEAST operational overhead?

- A. Migrate the DB instance to a different instance class that has higher I/O capacity. Configure the users' applications to use the new DB instance.
- B. Create a proxy in RDS Proxy Configure the users' applications to use the DB instance through RDS Proxy
- C. Deploy Amazon ElastCache for Memcached between the users' application and the DB instance
- D. Configure Multi-AZ for the DB instance Configure the users' application to switch between the DB instances.

Answer: B

Explanation:
Many applications, including those built on modern serverless architectures, can have a large number of open connections to the database server and may open and close database connections at a high rate, exhausting database memory and compute resources. Amazon RDS Proxy allows applications to pool and share connections established with the database, improving database efficiency and application scalability.

NEW QUESTION # 93
At part of budget planning. management wants a report of AWS billed dams listed by user. The data will be used to create department budgets. A solution architect needs to determine the most efficient way to obtain this report Information Which solution meets these requirement?

- A. Create a report in Cost Explorer and download the report
- B. Modify a cost budget in AWS Budgets to alert with Amazon Simple Email Service (Amazon SES).
- C. Run a query with Amazon Athena to generate the report.
- D. Access the bill details from the running dashboard and download Via bill.

Answer: A

Explanation:
This option is the most efficient because it uses Cost Explorer, which is a tool that allows you to visualize, understand, and manage your AWS costs and usage over time1. You can create a report in Cost Explorer that lists AWS billed items by user, using the user name tag as a filter2. You can then download the report as a CSV file and use it for budget planning. Option A is less efficient because it uses Amazon Athena, which is a serverless interactive query service that allows you to analyze data in Amazon S3 using standard SQL3. You would need to set up an Athena table that points to your AWS Cost and Usage Report data in S3, and then run a query to generate the report. This would incur additional costs and complexity. Option C is less efficient because it uses the billing dashboard, which provides a high-level summary of your AWS costs and usage.
You can access the bill details from the billing dashboard and download them via bill, but this would not list the billed items by user. You would need to use tags to group your costs by user name, which would require additional steps. Option D is less efficient because it uses AWS Budgets, which is a tool that allows you to plan your service usage, service costs, and instance reservations.
You can modify a cost budget in AWS Budgets to alert with Amazon Simple Email Service (Amazon SES), but this would not

generate a report of AWS billed items by user. This would only notify you when your actual or forecasted costs exceed or are expected to exceed your budgeted amount.

NEW QUESTION # 94

A Company must collect temperature data form thousands of remote weather devices. The company must also store this data in a data warehouse to run aggregations and visualizations.
Which services will meet these requirements? (Select Two.)

- A. Amazon SQS
- B. Amazon DynamoDB
- C. Amazon SNS
- D. Amazon Redshift
- E. Amazon Kinesis Data Firehose

Answer: D,E

NEW QUESTION # 95

A client of yours has a huge amount of data stored on Amazon S3, but is concerned about someone stealing it while it is in transit. You know that all data is encrypted in transit on AWS, but which of the following is wrong when describing server-side encryption on AWS?

- A. In server-side encryption, you manage encryption/decryption of your data, the encryption keys, and related tools.
- B. Amazon S3 server-side encryption uses one of the strongest block ciphers available, 256-bit Advanced Encryption Standard (AES-256), to encrypt your data.
- C. Server-side encryption is about data encryption at rest-that is, Amazon S3 encrypts your data as it writes it to disks.
- D. Amazon S3 server-side encryption employs strong multi-factor encryption.

Answer: A

Explanation:
Amazon S3 encrypts your object before saving it on disks in its data centers and decrypts it when you download the objects. You have two options depending on how you choose to manage the encryption keys: Server-side encryption and client-side encryption. Server-side encryption is about data encryption at rest-that is, Amazon S3 encrypts your data as it writes it to disks in its data centers and decrypts it for you when you access it. As long as you authenticate your request and you have access permissions, there is no difference in the way you access encrypted or unencrypted objects. Amazon S3 manages encryption and decryption for you. For example, if you share your objects using a pre-signed URL, that URL works the same way for both encrypted and unencrypted objects.
In client-side encryption, you manage encryption/decryption of your data, the encryption keys, and related tools. Server-side encryption is an alternative to client-side encryption in which Amazon S3 manages the encryption of your data, freeing you from the tasks of managing encryption and encryption keys.
Amazon S3 server-side encryption employs strong multi-factor encryption. Amazon S3 encrypts each object with a unique key. As an additional safeguard, it encrypts the key itself with a master key that it regularly rotates. Amazon S3 server-side encryption uses one of the strongest block ciphers available,
2 56-bit Advanced Encryption Standard (AES-256), to encrypt your data.
