### NEW QUESTION # 77

When you query Customer, you discover that the query is slow to execute. You suspect that maintenance was NOT performed on the table.

You need to identify whether maintenance tasks were performed on Customer.

Solution: You run the following Spark SQL statement:

```
DESCRIBE HISTORY customer
```

Does this meet the goal?

- A. Yes
- B. No

**Answer: A**

### NEW QUESTION # 78

You have a Fabric tenant that contains a lakehouse named Lakehouse1. Lakehouse1 contains a table named Nyctaxi\_raw.

Nyctaxi\_raw contains the following columns.

You create a Fabric notebook and attach it to lakehouse1.

You need to use PySpark code to transform the data. The solution must meet the following requirements:

- \* Add a column named pickupDate that will contain only the date portion of pickupDateTime.

- \* Filter the DataFrame to include only rows where fareAmount is a positive number that is less than 100.

How should you complete the code? To answer, select the appropriate options in the answer area. NOTE:

Each correct selection is worth one point.

**Answer:**

Explanation:

Explanation:

Add the pickupDate column: `.withColumn("pickupDate", df["pickupDateTime"].cast("date"))` Filter the DataFrame: `.filter("fareAmount > 0 AND fareAmount < 100")` In PySpark, you can add a new column to a DataFrame using the `.withColumn` method, where the first argument is the new column name and the second argument is the expression to generate the content of the new column. Here, we use the `.cast("date")` function to extract only the date part from a timestamp. To filter the DataFrame, you use the `.filter` method with a condition that selects rows where fareAmount is greater than 0 and less than 100, thus ensuring only positive values less than 100 are included.

**NEW QUESTION # 79**

You are implementing a medallion architecture in a single Fabric workspace.

You have a lakehouse that contains the Bronze and Silver layers and a warehouse that contains the Gold layer.

You create the items required to populate the layers as shown in the following table.

You need to ensure that the layers are populated daily in sequential order such that Silver is populated only after Bronze is complete, and Gold is populated only after Silver is complete. The solution must minimize development effort and complexity.

What should you use to execute each set of items? To answer, drag the appropriate options to the correct items. Each option may be used once, more than once, or not at all. You may need to drag the split bar between panes or scroll to view content NOTE:

Each correct selection is worth one point.

**Answer:**

Explanation:

Explanation:

To execute each set of items in sequential order with minimized development effort and complexity, you should use the following options:

- \* Orchestration pipeline: Use a pipeline with an Invoke pipeline activity. This allows for orchestrating and scheduling the execution of other pipelines, ensuring they run in the correct sequence.

- \* Bronze layer: Implement a pipeline Copy activity. This aligns with the table indicating that the Bronze layer uses pipelines with Copy activities for data integration.

- \* Silver layer: Implement a pipeline Dataflow activity. The table specifies that Dataflows are used for the Silver layer.

- \* Gold layer: Implement a pipeline Stored procedure activity. Stored procedures are specified for the Gold layer according to the table.
