

Pass Guaranteed Unparalleled Analytics-Arch-201 - Latest Salesforce Certified Tableau Architect Guide Files

Our users can prove to you that the hit rate of our Analytics-Arch-201 exam questions is very high. And you can just see the data how many customers are visiting our Analytics-Arch-201 study materials everyday. And the pass rate is also high as 98% to 100%. You can walk into the examination room with peace of mind, after which you will experience a very calm examination. As for the result, please come home and wait. Our Analytics-Arch-201 training prep will not disappoint you.

Our Analytics-Arch-201 study guide boosts many merits and functions. You can download and try out our Analytics-Arch-201 test question freely before the purchase. You can use our product immediately after you buy our product. We provide 3 versions for you to choose and you only need 20-30 hours to learn our Analytics-Arch-201 training materials and prepare the exam. The passing rate and the hit rate are both high. We provide 24-hours online customer service and free update within one year. And if you have a try on our Analytics-Arch-201 Exam Questions, you will find that there are many advantages of our Analytics-Arch-201 training materials.

Pass Guaranteed Salesforce - Updated Latest Analytics-Arch-201 Guide Files

Everything is changing so fast. So do not reject challenging new things. Our Analytics-Arch-201 study materials absolutely can add more pleasure to your life. You just need a chance to walk out. You can click to see the comments of the Analytics-Arch-201 exam braindumps and how we changed their life by helping them get the Analytics-Arch-201 Certification. And you can also see the pass rate of our Analytics-Arch-201 learning guide high as 98% to 100%, we can give you a promising future.

Salesforce Analytics-Arch-201 Exam Syllabus Topics:

| Topic | Details |
|---------|---|
| Topic 1 | <ul style="list-style-type: none">Deploy Tableau Server: This domain assesses the ability of Tableau Administrators to perform production-ready deployments of Tableau Server. It encompasses installing and configuring Tableau Server with external components, supporting air-gapped environments, disaster recovery validations, and blue-green deployments. It includes configuring and troubleshooting various authentication methods such as SAML, Kerberos, and LDAP. The section also covers implementing encryption strategies, installing and verifying Tableau Server on Linux and Windows platforms, resolving installation and configuration issues, and managing service accounts and logging. |
| | |

| | |
|---------|---|
| Topic 2 | <ul style="list-style-type: none"> • Design a Tableau Infrastructure: This section of the exam measures skills of Tableau Consultants and focuses on planning and designing a complex Tableau deployment. It covers gathering user requirements, licensing strategies including Authorization-to-Run, high availability and disaster recovery planning, and mapping server add-ons to the organization's needs. It includes planning and implementing Tableau Cloud with Bridge, authentication, user provisioning, and multi-site configuration. Additionally, it addresses migration planning across Tableau products, operating systems, identity stores, and consolidations, as well as designing process topologies, sizing, node roles, and recommending server configurations including security, hardware, and disaster recovery. |
| Topic 3 | <ul style="list-style-type: none"> • Monitor and Maintain a Tableau Deployment: This section evaluates skills of Tableau Administrators in monitoring, maintaining, and optimizing Tableau environments. It involves creating custom administrative dashboards, conducting load testing using tools like TabJolt, and analyzing test results. Troubleshooting complex performance bottlenecks in workbooks and server resources is key, as is tuning caching and scaling strategies. It covers leveraging observability tools such as the Resource Monitoring Tool, analyzing logs and metrics, and adjusting architecture accordingly. Automation of maintenance functions using APIs, scripting, and scheduling is included, along with managing server extensions, content automation, dashboard extensions, web data connectors, and secure embedded solutions. |

Salesforce Certified Tableau Architect Sample Questions (Q89-Q94):

NEW QUESTION # 89

How does the Tableau Server Resource Monitoring Tool contribute to the observability of a Tableau Server environment in terms of system resource usage?

- A. It offers insights into server resource utilization, such as CPU, memory, and disk usage
- B. It provides real-time alerts for any changes in user permissions and security settings
- C. It monitors network bandwidth usage between the Tableau Server and client applications
- D. It tracks changes in workbook and dashboard designs to assess their impact on performance

Answer: A

Explanation:

It offers insights into server resource utilization, such as CPU, memory, and disk usage The Tableau Server Resource Monitoring Tool is instrumental in providing observability into system resource usage. It offers detailed insights into how the server utilizes resources like CPU, memory, and disk space, allowing administrators to identify potential bottlenecks and optimize server performance accordingly. Option A is incorrect because the Resource Monitoring Tool focuses on system resources, not on monitoring changes in permissions and security settings. Option C is incorrect as the tool is designed to monitor server resource usage, not to track design changes in workbooks and dashboards. Option D is incorrect because it primarily monitors server resource utilization, not network bandwidth usage between the server and clients.

NEW QUESTION # 90

In validating a disaster recovery plan for Tableau Server, what aspect is critical to assess to ensure minimal downtime in case of a system failure?

- A. The physical distance between the primary and backup servers
- B. The efficiency and speed of the backup restoration process
- C. The compatibility of the backup data with different versions of Tableau Server
- D. The total size of data backups

Answer: B

Explanation:

The efficiency and speed of the backup restoration process The efficiency and speed of the backup restoration process are key factors in ensuring minimal downtime during a disaster recovery scenario. Quick and efficient restoration means that the Tableau Server can be brought back online promptly, reducing the impact on business operations. Option A is incorrect as the total size of data backups, while impacting storage requirements, does not directly determine the downtime during a recovery. Option B is incorrect because while compatibility is important, it does not directly impact the speed of recovery in a disaster situation. Option D is incorrect as the physical distance between servers can affect certain aspects of disaster recovery planning, but it is not the primary

factor in ensuring minimal downtime.

NEW QUESTION # 91

During the validation of a disaster recovery/high availability strategy for Tableau Server, what is a key element to test to ensure data integrity?

- A. Frequency of complete system backups
- **B. Accuracy of data and dashboard recovery post-failover**
- C. Network bandwidth availability during the failover process
- D. Speed of the failover to a secondary server

Answer: B

Explanation:

Accuracy of data and dashboard recovery post-failover The accuracy of data and dashboard recovery post-failover is crucial in validating a disaster recovery/high availability strategy. This ensures that after a failover, all data, visualizations, and dashboards are correctly re-stored and fully functional, maintaining the integrity and continuity of business operations. Option A is incorrect because while the frequency of backups is important, it does not directly validate the effectiveness of data recovery in a disaster scenario. Option B is incorrect as the speed of failover, although important for minimizing downtime, does not alone ensure data integrity post-recovery. Option D is incorrect because network bandwidth, while impacting the performance of the failover process, does not directly relate to the accuracy and integrity of the recovered data and dashboards.

NEW QUESTION # 92

For a financial institution using Tableau Server, which disaster recovery strategy would be most appropriate to safeguard against data loss and ensure regulatory compliance?

- A. Opting for a low-cost disaster recovery option that involves manual backups on removable drives
- **B. A robust disaster recovery plan with frequent, encrypted backups, off-site storage, and quick recovery mechanisms**
- C. A basic disaster recovery plan that focuses only on infrequent backups to an on-site server
- D. Implementing a cloud-only disaster recovery strategy without any on-premises backup solutions

Answer: B

Explanation:

A robust disaster recovery plan with frequent, encrypted backups, off-site storage, and quick recovery mechanisms For a financial institution, a comprehensive disaster recovery plan with frequent encrypted backups, off-site storage, and rapid recovery capabilities is essential to protect sensitive financial data and ensure compliance with regulatory standards. Option A is incorrect as infrequent backups and on-site storage may not meet the stringent requirements for data protection in finance. Option C is incorrect because manual backups on removable drives are not reliable or secure enough for financial data. Option D is incorrect as relying solely on a cloud-based solution may not comply with certain regulatory requirements for financial institutions.

NEW QUESTION # 93

In configuring a Tableau Server deployment, you decide to assign a background process to a specific node. What is the primary reason for dedicating a node to the background process?

- A. To allow direct access to the database server from the background node
- **B. To improve performance by isolating resource-intensive tasks from user-facing operations**
- C. To enable easier maintenance and updates of the background process without affecting other services
- D. To enhance the security of sensitive data processed in the background tasks

Answer: B

Explanation:

To improve performance by isolating resource-intensive tasks from user-facing operations Dedicating a node to the background process in Tableau Server is primarily done to isolate resource-intensive tasks, such as data extraction and subscription tasks, from user-facing operations. This separation helps in optimizing performance by ensuring that the background's demand on system resources does not impact the responsiveness or efficiency of the user interface and vice versa. Option A is incorrect because while security is important, it is not the primary reason for dedicating a node to the background process. Option C is incorrect as direct

database access from the background node is not the main factor in this configuration decision. Option D is incorrect because while easier maintenance is a benefit, it is not the primary reason for isolating the back-grounder process on a specific node.

NEW QUESTION # 94
