### CompTIA A+ Certification Exam: Core 2 Sample Questions (Q504-Q509):

#### NEW QUESTION # 504

A technician is troubleshooting a mobile device that was dropped. The technician finds that the screen (ails to rotate, even though the settings are correctly applied. Which of the following pieces of hardware should the technician replace to resolve the issue?

- A. Digitizer
- B. Battery
- C. Accelerometer
- D. LCD

**Answer: C**

Explanation:

The piece of hardware that the technician should replace to resolve the issue of the screen failing to rotate on a mobile device that was dropped is the accelerometer. The accelerometer is a sensor that detects the orientation and movement of the mobile device by measuring the acceleration forces acting on it. The accelerometer allows the screen to rotate automatically according to the position and angle of the device. If the accelerometer is damaged or malfunctioning, the screen may not rotate properly or at all, even if the settings are correctly applied. LCD stands for Liquid Crystal Display and is a type of display that uses liquid crystals and backlight to produce images on the screen. LCD is not related to the screen rotation feature but to the quality and brightness of the display. Battery is a component that provides power to the mobile device by storing and releasing electrical energy. Battery is not related to the screen rotation feature but to the battery life and performance of the device. Digitizer is a component that converts touch inputs into digital signals that can be processed by the mobile device. Digitizer is not related to the screen rotation feature but to the touch sensitivity and accuracy of the display. **Answer: B**

#### NEW QUESTION # 506

Which of the following is the best way to secure access and data on a mobile device?

- A. Malware protection
- B. Biometric screen locks
- C. Login attempt restrictions
- D. Operating system patches

**Answer: B**

#### NEW QUESTION # 507

A user has been adding data to the same spreadsheet for several years. After adding a significant amount of data, they are now unable to open the file. Which of the following should a technician do to resolve the issue?

- A. Defragment the storage drive.
- B. Upgrade the network connection speed.
- **C. Increase the amount of RAM.**
- D. Revert the spreadsheet to the last restore point.

**Answer: C**

#### NEW QUESTION # 508

A company recently experienced a security incident in which a USB drive containing malicious software was able to covertly install malware on a workstation. Which of the following actions should be taken to prevent this Incident from happening again? (Select two).

- **A. Update the antivirus definitions.**
- B. Install a host-based IDS
- C. Restrict user permissions.
- **D. Disable AutoRun.**
- E. Update the password complexity
- F. Enable a BIOS password
- G. Restrict log-in times.

**Answer: A,D**

Explanation:

The correct answers are E and . Disabling AutoRun and updating the antivirus definitions are two actions that should be taken to prevent the incident from happening again.

AutoRun is a feature of Windows that automatically executes a predetermined action when a removable media such as a USB drive is inserted in a computer. For example, AutoRun can launch or install a new program on the media, or open the file in File Explorer. However, this feature can also be exploited by malicious software that can run without the user's consent or knowledge. Therefore, disabling AutoRun can help prevent accidental installation of viruses and other malware from USB drives<sup>123</sup>.

Updating the antivirus definitions is another important action that can help prevent malware infections from USB drives. Antivirus definitions are files that contain information about the latest known threats and how to detect and remove them. By updating the antivirus definitions regularly, you can ensure that your antivirus software can recognize and block any malicious software that may be on the USB drive before it can harm your computer<sup>45</sup>.

A host-based IDS is a system that monitors and analyzes the activity on a single computer or device for any signs of intrusion or malicious behavior. A host-based IDS can help detect and prevent malware infections from USB drives, but it is not a sufficient action by itself. A host-based IDS needs to be complemented by other security measures, such as disabling AutoRun and updating the antivirus definitions<sup>6</sup>.

Restricting login times, enabling a BIOS password, and updating the password complexity are all actions that can help improve the security of a computer or device, but they are not directly related to preventing malware infections from USB drives. These actions can help prevent unauthorized access to the computer or device, but they do not affect how the computer or device interacts with the USB drive or its contents.

Restricting user permissions is an action that can help limit the damage that malware can cause on a computer or device, but it does not prevent the malware from being installed in the first place. Restricting user permissions means limiting what actions a user can perform on the computer or device, such as installing or deleting programs, modifying system settings, or accessing certain files or folders. By restricting user permissions, you can reduce the impact of malware infections by preventing them from affecting other users or system components<sup>7</sup>.
