UiPath Automation Business Analyst Associate Exam (2023.10) Sample Questions (Q81-Q86):

NEW QUESTION # 81

Which of the following best describes how automation software robots operate?

- A. They require constant human supervision.
- **B. They mimic human actions to interact with digital systems and applications.**
- C. They physically interact with machines to perform tasks.
- D. They write code autonomously.

Answer: B

Explanation:

Automation software robots, particularly those built using UiPath, operate by mimicking human actions to interact with digital systems and applications. This includes actions such as clicking buttons, typing into fields, reading data from screens, extracting information from documents, navigating applications, and triggering system events. Their behavior is defined through automation workflows created by developers using tools like UiPath Studio.

These robots do not require constant supervision; unattended robots operate autonomously, while attended robots are triggered by users. They also do not interact physically with machines. Instead, they work entirely within virtual environments, desktops, and applications.

By replicating human behavior in digital workflows, robots can perform repetitive, rule-based tasks consistently, quickly, and without fatigue. This enables organizations to improve operational efficiency, reduce human error, increase accuracy, and free employees to focus on more strategic work.

Software robots do not write code on their own-developers design their workflows. However, with AI enhancements, they can assist in automation development. Still, their core functionality relies on executing predefined instructions that simulate human interaction with digital systems.

NEW QUESTION # 82

Which of the following best describes the Automation Business Analyst's role during the Process Analysis stage?

- A. Approves solution architecture
- B. Defines coding best practices
- C. Handles infrastructure provisioning
- **D. Analyzes the As-Is process and defines the To-Be process**

Answer: D

Explanation:

During the Process Analysis stage, the Automation Business Analyst is responsible for analyzing the current (As-Is) process and defining the future (To-Be) process to be automated. This includes mapping out each step, understanding business rules, identifying inefficiencies, and collaborating with stakeholders to envision how automation will change the process.

The Business Analyst also works closely with the Solution Architect to prepare the Process Definition Document (PDD) and ensures that the process is well-documented for the developers to understand and automate.

This role is essential for bridging the gap between business users and technical implementers, ensuring that the solution reflects the true needs of the business while being technically feasible.

NEW QUESTION # 83

Which of the following best describes the main benefit of documenting an organized lifecycle for automation projects?

- A. Reduces the need for communication among teams
- B. Increased need for manual approval
- C. Delays in testing and review
- **D. Consistent quality, faster turnaround, and successful implementations**

Answer: D

Explanation:

Documenting and following an organized lifecycle for automation projects - as outlined in the UiPath Automation Implementation

Methodology - leads to consistent quality, faster turnaround times, and more successful implementations.

Each stage in the lifecycle - from Kickoff to Project Closure - has defined roles, responsibilities, deliverables, and checkpoints. This structured approach helps teams stay aligned, reduces misunderstandings, enables better risk management, and ensures that issues are caught early.

With a clear lifecycle, automation projects become repeatable, scalable, and manageable, even as the number of automated processes grows. This approach supports long-term success and helps organizations build sustainable automation programs with measurable value.

NEW QUESTION # 84

Which document outlines the future state of the process and modules to be developed?

- A. Statement of Work (SOW)
- B. Project Charter
- C. Solution Design Document (SDD)
- D. UAT Test Script

Answer: C

Explanation:

The Solution Design Document (SDD) outlines the future state (To-Be) of the business process, including the detailed technical components and modules to be developed. It is a critical output of the Solution Design stage and serves as the blueprint for the development team.

The SDD includes:

- * Automation logic and flow diagrams
- * Breakdown of reusable modules
- * Exception handling logic
- * Integration and system interaction points
- * Technical configurations and assumptions

Prepared primarily by the Solution Architect, the SDD ensures that development follows a clear and consistent direction. It helps prevent misinterpretation of business requirements and facilitates better collaboration among developers, testers, and architects.

NEW QUESTION # 85

What does Automation Implementation Methodology ensure?

- A. Inconsistent delivery quality with flexible tools
- B. Consistent quality, faster and more reliable implementations, and quicker process handovers
- C. Independent project execution with minimal team coordination
- D. Increased cost of automation with flexible timelines

Answer: B

Explanation:

The UiPath Automation Implementation Methodology ensures consistent quality, faster and more reliable implementations, and quicker process handovers by establishing a structured and well-defined approach to automation projects. This methodology includes stages from kickoff to project closure, each involving specific stakeholders, defined deliverables, and quality assurance measures.

The methodology helps organizations deliver automation projects in a repeatable and predictable way, reducing variability in outcomes and enhancing stakeholder satisfaction. It incorporates best practices that align the Client Team and the Implementation Team, ensuring both sides have clear expectations and roles. It also facilitates early identification of risks, effective communication, and streamlined deployment, which leads to faster turnarounds.

Moreover, by following a proven framework, the implementation team can avoid redundant efforts, minimize rework, and focus on value creation. This ultimately leads to more scalable and maintainable automation solutions, reduced time-to-value, and smoother transitions from development to production.
