Pass4SureQuiz Analytics-Admn-201 valid exam dumps will help you pass the actual test at first time, and you do not try again and again. Try the Salesforce Analytics-Admn-201 free demo and assess the validity of our Analytics-Admn-201 practice torrent. You will enjoy one year free update after purchase of Salesforce study dumps. The comprehensive contents of Analytics-Admn-201 Pdf Dumps will clear your confusion and ensure a high pass score in the real test.

Salesforce Analytics-Admn-201 Exam Syllabus Topics:

Topic	Details
Topic 1	• Migration & Upgrade: This section of the exam measures the skills of System Engineers and covers the process of upgrading and migrating Tableau Server environments. Candidates should understand how to carry out clean reinstalls, migrate servers to new hardware, and maintain backward compatibility during the process.
Topic 2	• Administration: This section of the exam measures the skills of Tableau Administrators and covers the day-to-day tasks of maintaining Tableau Server. Candidates should understand how to create and manage schedules, subscriptions, backups, and restores, as well as how to use tools such as TSM, Tabcmd, and REST API. It emphasizes monitoring, server analysis, log file usage, and embedding practices. It also includes managing projects, sites, and nested structures, while contrasting end-user and administrator abilities. Knowledge of publishing, web authoring, sharing views, caching, and data source certification is also tested.
Topic 3	• Installation and Configuration: This section of the exam measures the skills of Server Engineers and covers the process of installing Tableau Server, understanding installation paths, identity store options, SSO integrations, SSL setup, and silent installs. Candidates also need to demonstrate the ability to configure Tableau Server by setting cache, distributing processes, customizing sites, and configuring user quotas. It further includes adding users, managing their roles and permissions, and applying Tableau's security model at different levels from sites to workbooks.

Topic 4	Connecting to and Preparing Data: This section of the exam measures the skills of Tableau Administrators and covers the basic understanding of Tableau Server's interface, navigation, and overall topology. Candidates are expected to recognize both client and server components, understand how these interact, and know where to find information about versions, releases, and updates. It also focuses on system requirements, including hardware, operating systems, browsers, email configurations, cloud considerations, and licensing models. Additionally, it examines knowledge of server processes, data source types, network infrastructure, and ports needed for a stable deployment.
Topic 5	Troubleshooting: This section of the exam measures the skills of Support Specialists and covers resolving common Tableau Server issues. Candidates must know how to reset accounts, package logs, validate site resources, rebuild search indexes, and use analysis reports. It also includes understanding the role of browser cookies and creating support requests when needed.

Analytics-Admn-201 Exam Reference | Analytics-Admn-201 Dump Collection

How Pass4SureQuiz will help you in passing the Salesforce Certified Tableau Server Administrator? Pass4SureQuiz online digital Salesforce Analytics-Admn-201 exam questions are the best way to prepare. Using our Salesforce Analytics-Admn-201 Exam Dumps, you will not have to worry about whatever topics you need to master.

Salesforce Certified Tableau Server Administrator Sample Questions (Q28-Q33):

NEW QUESTION # 28

You activate the same Tableau Server product key on three installations for Dev, Test, and Production. You plan to move the Test environment to new hardware. What is the recommended workflow for managing the product key?

- A. Install and activate Tableau Server on the new hardware and keep the existing Test environment as a backup
- B. Install and activate Tableau Server on the new hardware, and then run the following script in the old environment: `tableau-server-obliterate.cmd -y -y -y`
- C. Deactivate the product key on the existing Test environment, and then install and activate Tableau Server on the new hardware**
- D. Install and activate Tableau Server on the new hardware, and then deactivate it on the old hardware

Answer: C

Explanation:

Tableau Server's licensing ties product keys to specific machines. Moving an environment requires managing activations to stay compliant. Let's break this down:

* Licensing Rules:

* A product key can be activated on multiple machines (e.g., Dev, Test, Prod), but only up to the licensed limit (typically 3 for such setups).

* Deactivation frees the key for reuse elsewhere.

* Recommended Workflow:

* Deactivate first: Use `tsm licenses deactivate` on the old Test machine to release the key.

* Then activate: Install on the new hardware and activate with `tsm licenses activate -k <key>`.

* Why: Ensures compliance and avoids activation conflicts (e.g., exceeding the key's limit).

* Option B (Deactivate on Test, then install/activate on new hardware): Correct.

* Steps:

* On old Test: `tsm licenses deactivate`.

* Install Tableau Server on new hardware.

* On new Test: `tsm licenses activate -k <key>`.

* Benefit: Clean, compliant transfer-preserves license integrity.

* Option A (Activate new, then deactivate old): Incorrect.

* Risk: If the key's limit is reached (e.g., 3 activations), the new activation fails until deactivation occurs. Order matters.

* Option C (Activate new, keep old as backup): Incorrect.

- * Issue: Exceeds license limit (4 activations) and risks non-compliance. Backup requires deactivation or a separate key.
- * Option D (Activate new, obliterate old): Incorrect.
- * Details: `tableau-server-obliterate.cmd` wipes the entire install (data, config)-overkill and doesn't formally deactivate the key via TSM, potentially leaving licensing inconsistent.

Why This Matters: Proper license management prevents activation errors and ensures legal use across environments.
Reference: Tableau Server Documentation - "Manage Product Keys" (https://help.tableau.com/current/server/en-us/license_manage.htm).

NEW QUESTION # 29

You need to verify the status of the Coordination Service ensemble in a high-availability (HA) Tableau Server cluster. What should you do?

- A. Examine the Tableau Server Status page
- B. Run the command `tsm maintenance ziplogs`
- C. Run the command `tsm status -v`
- D. Examine the Tableau Services Manager (TSM) web client Status page

Answer: C

Explanation:

In an HA Tableau Server cluster, the Coordination Service (ZooKeeper ensemble) maintains cluster state- let's find the best way to check it:

- * Coordination Service:
- * Runs on multiple nodes (3 or 5 in HA) to ensure quorum and failover.
- * Status indicates if it's running and synced-critical for cluster health.
- * Option C (Run `tsm status -v`): Correct.
- * Details: `tsm status --verbose` lists all processes across nodes, including Coordination Service (e.g., "Coordination Service: RUNNING").
- * Why Best: Provides detailed, node-specific status in the CLI-e.g., "Node 1: RUNNING, Node 2: RUNNING."
- * Use: Run on the initial node; `-v` ensures full output.
- * Option A (TSM web client Status page): Incorrect.
- * Why: The TSM UI (Server > Status) shows process counts (e.g., "Coordination Service: 3 instances"), but not detailed per-node status-less granular than CLI.
- * Option B (`tsm maintenance ziplogs`): Incorrect.
- * Why: Generates log archives for troubleshooting, not a real-time status check.
- * Option D (Tableau Server Status page): Incorrect.
- * Why: The Server Status page (Server > Status in the web UI) monitors application processes (e.g., VizQL), not TSM's Coordination Service.

Why This Matters: Coordination Service health ensures HA stability-`tsm status -v` is the admin's go-to for precision.
Reference: Tableau Server Documentation - "Check Server Status" (https://help.tableau.com/current/server/en-us/tsm_status.htm).

NEW QUESTION # 30

If a user already exists as part of a group in Tableau Server, and Active Directory synchronization then applies a minimum site role to the group, what will happen to the existing user's site role?

- A. It will change to the minimum site role only if the minimum site role reduces access
- B. It will never change as a result of synchronization
- C. It will change to the minimum site role only if the minimum site role provides more access
- D. It will always change to the minimum site role

Answer: A

Explanation:

When Tableau Server uses Active Directory (AD) for authentication, group synchronization imports AD groups and assigns a minimum site role (e.g., Viewer, Explorer) to users in that group. This ensures users meet a baseline access level. The behavior for existing users during sync is:

- * If the user's current site role provides more access than the minimum (e.g., Explorer vs. Viewer), their role remains unchanged.
- * If the user's current role provides less access than the minimum (e.g., Unlicensed vs. Viewer), their role is upgraded to the

minimum.

This preserves higher privileges while enforcing a floor. "Reduces access" means the minimum role is lower than the current role (e.g., Viewer vs. Explorer), in which case the existing role stays.

* Option A (It will change to the minimum site role only if the minimum site role reduces access):

Correct. The user's role changes only if the minimum increases access (e.g., Unlicensed to Viewer); otherwise, it stays higher.

* Option B (It will change only if the minimum provides more access): Incorrect wording. This is the inverse of the actual behavior—change occurs when needed to meet the minimum, not to exceed it.

* Option C (It will always change): Incorrect. Existing higher roles are preserved.

* Option D (It will never change): Incorrect. It changes if the current role is below the minimum.

Reference: Tableau Server Documentation - "Synchronize Active Directory Groups" (https://help.tableau.com/current/server/en-us/groups_sync.htm).

NEW QUESTION # 31

You are the server administrator of a single-node Tableau Server installation. The server hosts five schedules that each execute once a day: Weekday 3:00 PM Extract Refresh, Weekday 5:00 PM Subscription, Weekday 2:00 AM Extract Refresh, Weekday 7:00 AM Extract Refresh, and Weekday 8:00 AM Subscription. The schedules are scheduled to execute during periods when Tableau Server is least active. The busiest period for your server is immediately after the workday begins at 9:00 AM. The office of the CEO reports that every morning at 9:00 AM, they access the views in a particular workbook. The data for these views is refreshed by a task associated with the 7:00 AM schedule. The CEO reports that the data in the views is only being refreshed about 70% of the time. What should you do to attempt to resolve the CEO's problem?

- **A. Set the priority of this task to 1**
- B. Set the default priority of this schedule to 50
- C. Set the priority of this task to 100
- D. Set the priority for all other tasks to 50

Answer: A

Explanation:

In Tableau Server, schedules manage tasks like extract refreshes and subscriptions. Each task within a schedule has a priority value (ranging from 1 to 100, where 1 is the highest priority and 100 is the lowest). Tasks with higher priority (lower numbers) are executed before tasks with lower priority (higher numbers) when queued by the Background process. If the Background process is overloaded or delayed, lower-priority tasks may not complete on time, leading to inconsistent refreshes.

In this scenario:

The 7:00 AM Extract Refresh task is critical for the CEO's workbook, but the data is only refreshed 70% of the time by 9:00 AM. The server has a single node, meaning a single Background process handles all tasks. With five schedules (some overlapping in the early morning), contention or delays could prevent the 7:00 AM task from completing reliably before 9:00 AM.

Option C (Set the priority of this task to 1): Correct. Setting the task priority to 1 ensures it has the highest priority among all queued tasks. This increases the likelihood that the Background process executes it promptly at 7:00 AM, completing the refresh before the CEO accesses the workbook at 9:00 AM. You can adjust task priority in the Tableau Server web interface under Schedules > Tasks > Edit Priority.

NEW QUESTION # 32

What statement correctly describes locking permissions to a project?

- A. You can lock permissions to a project by setting the appropriate Project permission role
- **B. You can lock permissions to a project by changing Customizable to Locked**
- C. Content permissions are locked to a project by default
- D. Locking permissions to projects must be enabled on the Tableau Server Settings page

Answer: B

Explanation:

In Tableau Server, projects organize content (workbooks, data sources) and use permissions to control access. "Locking permissions" restricts how permissions are managed within a project—let's explore this exhaustively:

* Permission Management Modes:

* Managed by Owner: Default mode. Content owners (e.g., workbook publishers) can set permissions on their items, inheriting

project defaults as a starting point.

* Locked to the Project: Project-level permissions are enforced, and content owners cannot modify them. This ensures consistency across all items in the project.

* How to Lock:

* In the Tableau Server web UI:

* Go to Content > Projects.

* Select a project, click Actions > Permissions.

* In the Permissions dialog, change Permissions Management from "Customizable" (Managed by Owner) to "Locked."

* Set the desired permissions (e.g., Viewer, Editor) for users/groups, which then apply uniformly to all content.

* Via REST API: Use the updateProject endpoint with "permissionsLocked": true.

* Option B (You can lock permissions to a project by changing Customizable to Locked): Correct.

* Details: This is the precise action in the UI-switching from "Customizable" to "Locked" locks permissions at the project level.

* Impact: Owners lose the ability to override permissions on individual workbooks/data sources, enforcing governance.

* Example: Set "All Users" to Viewer (Locked)-all content in the project is view-only, regardless of owner intent.

* Option A (Locking permissions must be enabled on the Server Settings page): Incorrect.

* Why: Locking is a per-project setting, not a server-wide toggle. The Server Settings page (via TSM) controls global configs (e.g., authentication), not project permissions.

* Option C (Content permissions are locked by default): Incorrect.

* Default: New projects are "Managed by Owner" (Customizable), allowing flexibility unless explicitly locked by an admin.

* Option D (By setting the appropriate Project permission role): Incorrect.

* Confusion: "Project permission role" isn't a term-permissions are set via rules (e.g., Viewer, Editor), but locking is a separate action (Customizable # Locked).

Why This Matters: Locking permissions ensures uniform access control, critical for regulated environments or large teams where consistency trumps flexibility.

Reference: Tableau Server Documentation - "Lock Project Permissions" (https://help.tableau.com/current/server/en-us/permissions_lock.htm).

NEW QUESTION # 33

.....

With the rapid development of computer, network, and semiconductor techniques, the market for people is becoming more and more hotly contested. Passing a Analytics-Admn-201 exam to get a certificate will help you to look for a better job and get a higher salary. If you are tired of finding a high quality study material, we suggest that you should try our Analytics-Admn-201 Exam Prep. Because our Analytics-Admn-201 exam materials not only has better quality than any other same learn products, but also can guarantee that you can pass the Analytics-Admn-201 exam with ease.
