## INF-306 Valid Test Dumps - INF-306 Valid Exam Sims

All INF-306 exam questions are available at an affordable cost and fulfill all your training needs. Dupleader knows that applicants of the INF-306 examination are different from each other. Each candidate has different study styles and that's why we offer our HTML5 Application Development INF-306 product in three formats. These formats are IT Specialist INF-306 PDF, desktop practice test software, and web-based practice exam.

## IT Specialist HTML5 Application Development Sample Questions (Q25-Q30):

### NEW QUESTION # 25

You need to complete a postal code input form element (`post_code`). Include attributes to make the field mandatory, set the data type as text, and limit the input to five numeric digits.

Complete the code by selecting the correct option from each drop-down list.

Note: You will receive partial credit for each correct selection.

```
<form>
  <label for="post_code">Postal code</label>
  <input type="text" id="post_code" name="post_code"
    pattern="[0-9]{5}" title="5-digit postal code" required />
</form>
```

The image shows a code editor interface with three dropdown menus for selecting HTML attributes. The first dropdown is for the `type` attribute, the second for the `pattern` attribute, and the third for the `required` attribute. The correct selections are `type="text"`, `pattern="[0-9]{5}"`, and `required`.

### Answer:

Explanation:

```
<form>
  <label for="post_code">Postal code</label>
  <input type="text" id="post_code" name="post_code"
    pattern="[0-9]{5}" title="5-digit postal code" required />
</form>
```

The image shows the same code editor interface as above, but with green dashed boxes highlighting the correct attribute values: `type="text"`, `pattern="[0-9]{5}"`, and `required`.

Explanation:

First blank: type

Second blank: pattern

Third blank: required

The first blank must be type because the question requires the input data type to be text, producing `type="text"`. The second blank

must be pattern because `[0-9]{5}` is a regular expression that permits exactly five numeric digits. The third blank must be required because the postal code field must be mandatory before the form can be submitted.

### NEW QUESTION # 26

Review the following markup segment:

```
< form action= " process.js " method= " get " >  
< label for= " secretcode " > Secret Code < /label >  
< input type= " text " name= " secretcode "   
pattern= " [a-zA-Z]{4}-[0-9]{2}-[0-9]{4}-[a-zA-Z]{4} "   
placeholder= " secretcode " >  
< input type= " submit " value= " Submit " >  
< /form >
```

Which entry will validate successfully according to the required pattern?

- A. kukX-34-4938-WJDF
- B. y7Ts-A3-4876-ASFr
- C. AGbe-23h-234-HBG6
- D. Kgyn-23-3978-Uhj6

**Answer: A**

Explanation:

The correct answer is D because the pattern attribute requires the exact structure defined by the regular expression `[a-zA-Z]{4}-[0-9]{2}-[0-9]{4}-[a-zA-Z]{4}`. The first group, `[a-zA-Z]{4}`, requires exactly four alphabetic characters. The second group, `[0-9]{2}`, requires exactly two numeric digits. The third group, `[0-9]{4}`, requires exactly four numeric digits. The final group, `[a-zA-Z]{4}`, requires exactly four alphabetic characters. Hyphens must appear between each group. Option D, `kukX-34-4938-WJDF`, satisfies every part: `kukX` is four letters, `34` is two digits, `4938` is four digits, and `WJDF` is four letters. Option A fails because `Uhj6` contains a digit in the final letter-only group. Option B fails because `y7Ts` contains a digit in the first group and `A3` is not two digits. Option C fails because `23h` contains a letter and breaks the two-digit group.

References/topics: HTML5 input validation, pattern attribute, regular expressions, form constraint validation.

### NEW QUESTION # 27

Match each stage of Application Lifecycle Management to the task that occurs during that stage.

Move each stage from the list on the left to the correct task on the right.

Note: You will receive partial credit for each correct match.

Stages	Tasks
Deploy	Build the website.
Design	Publish the website.
Develop	Define the layout of the website.
Maintain	Monitor and update the website.
Plan	Evaluate the website for functionality and use.
Test	Identify the purpose and audience of the website.

**Answer:**

Explanation:

Explanation:

Task	Correct Stage
Build the website.	Develop
Publish the website.	Deploy
Define the layout of the website.	Design
Monitor and update the website.	Maintain
Evaluate the website for functionality and use.	Test
Identify the purpose and audience of the website.	Plan

Application Lifecycle Management organizes website creation into ordered stages that move from intent to implementation and long-term support. The Plan stage comes first because it establishes why the website exists, who the audience is, and what goals the application must satisfy. The Design stage converts those requirements into structure, including page layout, navigation, interface organization, and visual arrangement.

The Develop stage is where the website is built by writing HTML markup, CSS styling, JavaScript behavior, and integrating required assets or APIs. The Test stage evaluates whether the completed website functions correctly and is usable according to requirements; this includes checking features, layout behavior, validation, and user workflows. The Deploy stage publishes the finished website to the target hosting or production environment so users can access it. Finally, the Maintain stage occurs after release and includes monitoring, updating, fixing defects, improving compatibility, and keeping content or functionality current. References /topics: application lifecycle management, planning, design, development, testing, deployment, maintenance.

### NEW QUESTION # 28

You are creating the styling for your webpage. Which two CSS attributes produce a scroll bar if your content overflows its element? Choose 2.

- A. hidden
- B. visible
- C. auto
- D. scroll

Answer: C,D

Explanation:

The correct values are scroll and auto. The CSS overflow property controls what happens when content is too large to fit inside an element's box. MDN describes overflow as setting the desired behavior when content does not fit inside the element's padding box. The value overflow: scroll creates a scroll container and displays scrollbars so overflowing content can be reached, even when the scrollbar may not be strictly needed in some rendering environments. The value overflow: auto also creates scrolling behavior when content overflows, but it is conditional: scrollbars appear only when the content exceeds the available box size. hidden is incorrect because it clips overflowing content and hides the excess rather than exposing it through a scrollbar. visible is also incorrect because it allows overflow to render outside the element box and does not create a scroll container. Therefore, when the question asks which settings produce a scrollbar if content overflows, the precise answers are scroll and auto. References/topics: CSS overflow, scroll containers, overflow clipping, automatic scrollbars, layout flow.

### NEW QUESTION # 29

Which element should you use to rotate an SVG square?

- A. animateMotion
- B. animateTransform
- C. path
- D. circle

**Answer: B**

Explanation:

The correct element is animateTransform. In SVG, rotation is not produced by drawing a different shape; it is produced by applying a transformation to an existing graphical element, such as a < rect > representing a square. The < animateTransform > element is specifically designed to animate the transform attribute of a target SVG element, and its supported transformation types include translation, scaling, rotation, and skewing.

Therefore, to rotate a square, the square would normally be defined with a shape element such as < rect > , and an < animateTransform > child or associated animation would specify attributeName= " transform " and type= " rotate ". animateMotion is incorrect because it moves an element along a motion path rather than rotating the element itself. circle is a shape element, not an animation mechanism. path defines arbitrary vector geometry, but it does not by itself animate or rotate another object.

References/topics: SVG graphics, SVG transformations, animation elements, transform attribute, rotation animation.

### NEW QUESTION # 30

.....

IT Specialist INF-306 certifications are thought to be the best way to get good jobs in the high-demanding market. There is a large range of INF-306 certifications that can help you improve your professional worth and make your dreams come true. Our HTML5 Application Development INF-306 Certification Practice materials provide you with a wonderful opportunity to get your dream certification with confidence and ensure your success by your first attempt.
