- B. NO

Answer: B

NEW QUESTION # 182

A retail company needs to implement a solution to capture data updates from multiple Amazon Aurora MySQL databases. The company needs to make the updates available for analytics in near real time. The solution must be serverless and require minimal maintenance. Which solution will meet these requirements with the LEAST operational overhead?

- A. Set up AWS Database Migration Service (AWS DMS) tasks that perform schema conversions for each database. Load the changes into Amazon Redshift Serverless.
- B. Use Aurora zero-ETL integrations with Amazon Redshift Serverless for each database to load Aurora MySQL changes in Amazon Redshift Serverless.
- C. Use AWS Database Migration Service (AWS DMS) to set up binary log replication to Amazon Kinesis Data Streams. Load the data into Amazon Redshift Serverless after schema conversion.
- D. Use Amazon Managed Streaming for Apache Kafka (Amazon MSK) Connect with Debezium connectors to load data into Amazon Redshift Serverless.

Answer: B

Explanation:

Aurora zero-ETL integration with Amazon Redshift Serverless is the most direct fit because it delivers near real-time data availability for analytics with a fully managed approach and minimal maintenance. It avoids building and operating custom CDC pipelines, streaming infrastructure, or connector frameworks, which gives it the least operational overhead for multiple Aurora MySQL databases.

NEW QUESTION # 183

- B. An external function does not contain its own code; instead, the external function calls code that is stored and executed outside Snowflake.
- C. An external function is a type of UDF.
- D. Inside Snowflake, the external function is stored as a API Integration object.

that are in multiple formats.

The data engineer needs to automate the transfer process and must schedule the process to run periodically.

Which AWS service should the data engineer use to transfer the data in the MOST operationally efficient way?

- A. AWS Direct Connect
- B. AWS Glue
- C. AWS DataSync
- D. Amazon S3 Transfer Acceleration

Answer: C

Explanation:

AWS DataSync is a managed data transfer service that simplifies and accelerates moving large amounts of data online between on-premises storage and Amazon S3, EFS, or FSx for Windows File Server. DataSync is optimized for efficient, incremental, and reliable transfers of large datasets, making it suitable for transferring 5 TB of data with daily updates.

- B. Short-lived tables (i.e. <1 day), such as ETL work tables, can be defined as transient to eliminate Fail-safe costs.
- C. Data stored in temporary tables is not recoverable after the table is dropped as they do not have fail-safe.
- D. Long-lived tables, such as fact tables, should always be defined as permanent to ensure they are fully protected by Fail-safe.
- E. If downtime and the time required to reload lost data are factors, permanent tables, even with their added Fail-safe costs, may offer a better overall solution than transient tables.
