Fortinet NSE 4 - FortiOS 7.6 Administrator Sample Questions (Q54-Q59):

NEW QUESTION # 54

Which three strategies are valid SD-WAN rule strategies for member selection? (Choose three answers)

- A. Lowest Cost (SLA) with load balancing
- B. Lowest Quality (SLA) with load balancing
- C. Best Quality with load balancing
- D. Manual with load balancing
- E. Lowest Cost (SLA) without load balancing

Answer: A,D,E

Explanation:

According to the FortiOS 7.6 Administrator Study Guide and official documentation, SD-WAN rules (services) determine the path selection for traffic matching specific criteria. Version 7.6 provides specific flexibility regarding how these strategies handle multiple member interfaces.

First, Manual with load balancing (Statement B) is a valid configuration. In the Manual strategy, the administrator orders interfaces by preference, but by enabling the Load balancing toggle, the FortiGate can distribute traffic across all members that are up. Second, the Lowest Cost (SLA) strategy has been enhanced to support two modes. When the load balancing option is disabled, it acts as Lowest Cost (SLA) without load balancing (Statement A), selecting the single lowest-cost link that meets the SLA. Alternatively, by enabling the toggle, it functions as Lowest Cost (SLA) with load balancing (Statement D), where the FortiGate distributes traffic across all interfaces that satisfy the SLA target, regardless of their individual costs.

Statements C and E are incorrect because "Lowest Quality" is not a recognized SD-WAN strategy, and the Best Quality strategy is specifically a priority-based selection for a single "best" link, meaning the load balancing toggle is not available in the GUI when this mode is selected.

NEW QUESTION # 55

A network administrator has enabled full SSL inspection and web filtering on FortiGate. When visiting any HTTPS websites, the browser reports certificate warning errors. When visiting HTTP websites, the browser does not report errors.

What is the reason for the certificate warning errors?

- A. The matching firewall policy is set to proxy inspection mode.
- B. The certificate used by FortiGate for SSL inspection does not contain the required certificate extensions.
- C. The browser does not trust the certificate used by FortiGate for SSL inspection.
- D. The option invalid SSL certificates is set to allow on the SSL/SSH inspection profile.

Answer: C

Explanation:

With full SSL inspection, FortiGate performs a man-in-the-middle process: it decrypts the HTTPS session, inspects it, then re-encrypts it. To do this, FortiGate presents a substitute certificate to the client, signed by the CA certificate configured in the SSL/SSH inspection profile (for example, Fortinet_CA_SSL or a custom enterprise CA).

Browsers will show certificate warning errors when the issuing CA is not trusted by the client device/browser trust store. This only happens for HTTPS because certificates are used in TLS; HTTP has no certificate exchange, so no warning appears.

Why the other options are incorrect:

A: Allowing invalid server certificates affects whether FortiGate blocks/permits connections to sites with bad certs; it does not fix the

client warning about FortiGate's substituted cert.

B: Proxy vs flow inspection mode does not inherently cause certificate warnings; the warning is about trust of the signing CA.

D: Missing extensions is not the typical reason across "any HTTPS website"; the standard reason is the client does not trust the FortiGate inspection CA

NEW QUESTION # 56

Refer to the exhibit. Which algorithm does SD-WAN use to distribute traffic that does not match any of the SD-WAN rules?

ID	Name	Source	Destination	Criteria	Members
IPv4 3					
1	Critical-DIA	4 LOCAL_SUBNET	Slack-Slack Dropbox-Web Bloomberg		port1 ✓ port2
2	Non-Critical-DIA	4 LOCAL_SUBNET	Addicting_Games Social.Media	Bandwidth	port2 ✓
3	Default-Internet	4 LOCAL_SUBNET	4 REMOTE_SUBNET	Latency	port1 port2
Implicit 1					
	sd-wan	4 all	4 all	Source-Destination IP	<input type="checkbox"/> any

- A. All traffic from a source IP to a destination IP is sent to the same interface.
- B. Traffic is distributed based on the number of sessions through each interface.
- C. Traffic is sent to the link with the lowest latency.
- D. All traffic from a source IP is sent to the same interface

Answer: A

Explanation:

For traffic that does not match any of the defined SD-WAN rules, the default implicit SD-WAN rule is applied. By default, the FortiGate uses a "source-destination IP-based" algorithm, which means all traffic from a specific source IP to a specific destination IP is sent through the same interface.

This ensures that a consistent path is used for traffic between the same source and destination IP addresses.

NEW QUESTION # 57

Refer to the exhibit, which shows a routing table.

Network	Gateway IP	Interfaces	Distance	Metric	Priority	Type
10.0.11.0/24	0.0.0.0	port4	0	0	0	Connected
10.0.12.0/24	0.0.0.0	port5	0	0	0	Connected
10.0.13.0/24	0.0.0.0	port6	0	0	0	Connected
100.65.0.0/24	0.0.0.0	port2	0	0	0	Connected
100.66.0.0/24	0.0.0.0	port3	0	0	0	Connected
172.20.1.0/24	100.66.0.254	port3	9	0	2	Connected
192.168.0.0/16	0.0.0.0	port1	0	0	0	Connected

An administrator wants to create a new static route so the traffic to the subnet 172.20.1.0/24 is routed through port2 only.

What are the two criteria that the administrator can use to achieve this objective? (Choose two.)

- A. The existing static route through port3 must have the distance set to 11.
- B. The new static route must have the distance set to 9.
- C. The new static route must have the priority set to 3.

- D. The new static route must have the metric set to 1.

Answer: A,B

Explanation:

From the online study guide: "The lower the metric, the higher the preference" and "The lower the priority, the higher the preference" so it can't be C nor D.

NEW QUESTION # 58

Which three statements about SD-WAN performance SLAs are true? (Choose three.)

- A. They rely on session loss and jitter.
- **B. All the SLA targets can be configured.**
- C. They monitor the state of the FortiGate device.
- **D. They are applied in a SD-WAN rule lowest cost strategy.**
- **E. They can be measured actively or passively.**

Answer: B,D,E

Explanation:

FortiGate performance SLAs monitor the state of each member-whether it is alive or dead-and measures the member packet loss, latency, and jitter.

When you configure a performance SLA, you can decide whether you want to monitor the link health actively or passively. In active monitoring, the performance SLA checks the health of the member periodically-by default every 500ms- sending probes from the member to one or two servers that act as a beacon. In passive monitoring, the performance SLA determines the health of a member based on the traffic passing through the member.

The SLA target section is optional. It's where you define the performance requirements of alive members (latency, jitter, and packet loss thresholds). The performance SLA uses SLA targets with some SD-WAN rule strategies, like Lowest Cost (SLA), to decide if the link is eligible for traffic steering or not.
