It also covers the configuration changes using Terraform Apply and its options.</li></ul>
Topic 4	<ul style="list-style-type: none"><li>• Collaborate on infrastructure as code using HCP Terraform: In this section, the topics covered include analyzing the HCP Terraform run workflow, the role of HCP Terraform workspaces and their configuration options, and the management of provider credentials in HCP Terraform.</li></ul>

## Terraform-Associate-003 Valid Braindumps Book, Popular Terraform-Associate-003 Exams

You are in a quest for high quality practice materials like our Terraform-Associate-003 preparation exam. We avail ourselves of this opportunity to approach you to satisfy your needs. In order to acquaint you with our Terraform-Associate-003 practice materials, we wish to introduce a responsible company dealing with exclusively in area of Terraform-Associate-003 training engine and it is our company which keeps taking care of the readers' requests, desires and feeling about usage of our Terraform-Associate-003 study questions in mind.

### HashiCorp Certified: Terraform Associate (003) (HCTA0-003) Sample Questions (Q252-Q257):

#### NEW QUESTION # 252

In a Terraform Cloud workspace linked to a version control repository, speculative plan runs start automatically when you merge or commit changes to version control.

- A. False
- B. True

**Answer: A**

Explanation:

In Terraform Cloud, speculative plan runs are not automatically started when changes are merged or committed to the version control repository linked to a workspace. Instead, speculative plans are typically triggered as part of proposed changes in merge requests or pull requests to give an indication of what would happen if the changes were applied, without making any real changes to the infrastructure. Actual plan and apply operations in Terraform Cloud workspaces are usually triggered by specific events or configurations defined within the Terraform Cloud workspace settings.

References = This behavior is part of how Terraform Cloud integrates with version control systems and is documented in Terraform Cloud's usage guidelines and best practices, especially in the context of VCS-driven workflows.

#### NEW QUESTION # 253

The Terraform binary version and provider versions must match each other in a single configuration.

- A. False
- B. True

**Answer: A**

Explanation:

The Terraform binary version and provider versions do not have to match each other in a single configuration. Terraform allows you to specify provider version constraints in the configuration's terraform block, which can be different from the Terraform binary version<sup>1</sup>. Terraform will use the newest version of the provider that meets the configuration's version constraints<sup>2</sup>. You can also use the dependency lock file to ensure Terraform is using the correct provider version<sup>3</sup>.

References =

\* 1: Providers - Configuration Language | Terraform | HashiCorp Developer

\* 2: Multiple provider versions with Terraform - Stack Overflow

\* 3: Lock and upgrade provider versions | Terraform - HashiCorp Developer

#### NEW QUESTION # 254

A Terraform backend determines how Terraform loads state and stores updates when you execute which command?

- A. apply
- B. Both of these are correct.
- C. Neither of these are correct.
- D. destroy

**Answer: B**

Explanation:

- \* A Terraform backend determines where and how Terraform state is stored.
- \* Both terraform apply and terraform destroy interact with state, so Terraform needs access to the backend for state storage and updates.
- \* D (Neither are correct) is incorrect because Terraform state is required for both apply and destroy operations.

Terraform Backends

### NEW QUESTION # 255

All modules published on the official Terraform Module Registry have been verified by HashiCorp.

- A. False
- B. True

**Answer: A**

Explanation:

Not all modules published on the official Terraform Module Registry have been verified by HashiCorp. While HashiCorp verifies some modules, there are many community-contributed modules that are not verified. Verified modules have a "Verified" badge indicating that HashiCorp has reviewed them for security and best practices, but the registry also includes unverified modules.

Terraform Module Registry documentation: Terraform Registry

### NEW QUESTION # 256

All standard backend types support state locking, and remote operations like plan, apply, and destroy.

- A. False
- B. True

**Answer: A**

Explanation:

Not all standard backend types support state locking and remote operations like plan, apply, and destroy. For example, the local backend does not support remote operations and state locking. State locking is a feature that ensures that no two users can make changes to the state file at the same time, which is crucial for preventing race conditions. Remote operations allow running Terraform commands on a remote server, which is supported by some backends like remote or consul, but not all.
