- D. Social media integration

Answer: A,B

NEW QUESTION # 56

For a model in SAP Analytics Cloud you are using a live connection. Where is the data stored?

- A. Public dataset
- B. SAP Analytics Cloud model
- C. Embedded dataset
- D. Source system

Answer: D

Explanation:

When an SAP Analytics Cloud (SAC) model utilizes a live connection, the data is not stored within SAP Analytics Cloud itself. Instead, the data resides entirely in the source system. This means that SAC directly queries the data from the connected system (e.g., SAP HANA, SAP BW, SAP S/4HANA, or SAP Datasphere) in real-time every time a user interacts with the story or application. Only metadata, such as dimension definitions and measure aggregations, is stored in SAC. This approach offers several significant advantages: it ensures that users always work with the most current data, eliminates the need for data replication, and often addresses data privacy and security concerns by keeping sensitive data within the customer's secure landscape. The "live" nature means that any changes in the source system are immediately reflected in SAC.

NEW QUESTION # 57

What is a key benefit of using SAP Business Data Cloud for data governance?

Please choose the correct answer.

Response:

- A. Reduced data storage costs
- B. Real-time data visualization
- **C. Enhanced data security and compliance**
- D. Automated data entry

Answer: C

NEW QUESTION # 58

You want to combine external data with internal data via product ID. Although the data may be inconsistent, such as the external data contains the letter "O" where the internal data contains the digit 0, you still want to combine them. Which artifact should you use for matching?

- **A. Intelligent Lookup**
- B. Graphical View
- C. Analytic Model
- D. Entity Relationship Model

Answer: A

Explanation:

When faced with the challenge of combining data from different sources where the matching keys (like "Product ID") are inconsistent or contain variations (e.g., "O" vs. "0"), the recommended artifact in SAP Datasphere for such fuzzy or approximate matching scenarios is an Intelligent Lookup. An Intelligent Lookup (D) leverages machine learning capabilities to identify and map records that are semantically similar but not exact matches. Unlike standard joins in graphical views or SQL views which require precise key matches, Intelligent Lookups can handle data quality issues, typos, and variations, allowing you to successfully link disparate records that would otherwise be missed. This is particularly valuable when integrating data from external systems or legacy sources where perfect data standardization is not feasible, ensuring a more comprehensive and accurate combined dataset for analysis.
