## Latest GH-500 Exam Camp & GH-500 Sample Questions Answers

Our GitHub Advanced Security (GH-500) PDF dumps format contains Microsoft GH-500 questions that are real and updated. You can print these GitHub Advanced Security (GH-500) questions if you prefer an off-screen study. Otherwise, you can use this GH-500 PDF document from any location via your laptops, tablets, and smartphones. Time restrictions do not halt GitHub Advanced Security (GH-500) exam preparation as you can use GitHub Advanced Security (GH-500) exam dumps pdf whenever you have free time.

## Microsoft GitHub Advanced Security Sample Questions (Q46-Q51):

### NEW QUESTION # 46

Which of the following options would close a Dependabot alert?

- A. Viewing the dependency graph
- B. Leaving the repository in its current state
- C. Viewing the Dependabot alert on the Dependabot alerts tab of your repository
- D. Creating a pull request to resolve the vulnerability that will be approved and merged

**Answer: D**

Explanation:

A Dependabot alert is only marked as resolved when the related vulnerability is no longer present in your code - specifically after

you merge a pull request that updates the vulnerable dependency. Simply viewing alerts or graphs does not affect their status. Ignoring the alert by leaving the repo unchanged keeps the vulnerability active and unresolved.

#### NEW QUESTION # 47

A dependency has a known vulnerability. What does the warning message include?

- A. A brief description of the vulnerability
- B. How many projects use these components
- C. An easily understandable visualization of dependency change
- D. The security impact of these changes

#### Answer: A

Explanation:

When a vulnerability is detected, GitHub shows a warning that includes a brief description of the vulnerability. This typically covers the name of the CVE (if available), a short summary of the issue, severity level, and potential impact. The message also links to additional advisory data from the GitHub Advisory Database.

This helps developers understand the context and urgency of the vulnerability before applying the fix.

#### NEW QUESTION # 48

Assuming there is no custom Dependabot behavior configured, where possible, what does Dependabot do after sending an alert about a vulnerable dependency in a repository?

- A. Scans any push to all branches and generates an alert for each vulnerable repository
- B. Constructs a graph of all the repository's dependencies and public dependents for the default branch
- C. Creates a pull request to upgrade the vulnerable dependency to the minimum possible secure version
- D. Scans repositories for vulnerable dependencies on a schedule and adds those files to a manifest

#### Answer: C

Explanation:

After generating an alert for a vulnerable dependency, Dependabot automatically attempts to create a pull request to upgrade that dependency to the minimum required secure version-if a fix is available and compatible with your project.

This automated PR helps teams fix vulnerabilities quickly with minimal manual intervention. You can also configure update behaviors using dependabot.yml, but in the default state, PR creation is automatic.

#### NEW QUESTION # 49

Which CodeQL query suite provides queries of lower severity than the default query suite?

- A. `github/codeql/cpp/ql/src@main`
- B. `github/codeql-go/ql/src@main`
- C. `security-extended`

#### Answer: C

Explanation:

The security-extended query suite includes additional CodeQL queries that detect lower severity issues than those in the default security-and-quality suite.

It's often used when projects want broader visibility into code hygiene and potential weak spots beyond critical vulnerabilities. The other options listed are paths to language packs, not query suites themselves.

#### NEW QUESTION # 50

As a developer with write access, you navigate to a code scanning alert in your repository. When will GitHub close this alert?

- A. When you use data-flow analysis to find potential security issues in code

- B. After you triage the pull request containing the alert
- **C. After you fix the code by committing within the pull request**
- D. After you find the code and click the alert within the pull request

**Answer: C**

Explanation:

GitHub automatically closes a code scanning alert when the vulnerable code is fixed in the same branch where the alert was generated, usually via a commit inside a pull request. Simply clicking or triaging an alert does not resolve it. The alert is re-evaluated after each push to the branch, and if the issue no longer exists, it is marked as resolved.

## NEW QUESTION # 51

.....

You can become more competitive force in the job hunting market and you can also improve your ability in the process of getting a certificate. GH-500 study materials of us will help you get the certificate successfully. With experienced experts to compile GH-500 study materials, they are high-quality and accuracy, and you can pass the exam just one time. Moreover, we offer you free demo, and you can have a try before buying GH-500 Exam Dumps, so that you can have a better understanding of what you are going to buy.
