It is quite clear that many people would like to fall back on the most authoritative company no matter when they have any question about preparing for SAP-C02 exam or met with any problem. I am proud to tell you that our company is definitely one of the most authoritative companies in the international market for SAP-C02 Exam. What's more, we will provide the most considerate after sale service for our customers in twenty four hours a day seven days a week, therefore, our company is really the best choice for you to buy the SAP-C02 training materials.

The AWS Certified Solutions Architect - Professional (SAP-C02) exam is a professional-level certification exam offered by Amazon Web Services (AWS). AWS Certified Solutions Architect - Professional (SAP-C02) certification exam is designed for IT professionals who have experience in designing and deploying scalable, highly available, and fault-tolerant systems on AWS. SAP-C02 Exam Tests the candidate's knowledge of advanced AWS services, cloud architecture patterns, and best practices for designing and deploying AWS solutions.

>> SAP-C02 Valid Test Test <<

Quiz Amazon - SAP-C02 - Efficient AWS Certified Solutions Architect - Professional (SAP-C02) Valid Test Test

Each candidate will enjoy one-year free update after purchased our SAP-C02 dumps collection. We will send you the latest SAP-C02 dumps pdf to your email immediately once we have any updating about the certification exam. And there are free demo of SAP-C02 Exam Questions in our website for your reference. Our Amazon exam torrent is the best partner for your exam preparation.

Amazon AWS Certified Solutions Architect - Professional (SAP-C02) Sample Questions (Q170-Q175):

NEW QUESTION # 170

A telecommunications company is running an application on AWS. The company has set up an AWS Direct Connect connection between the company's on-premises data center and AWS. The company deployed the application on Amazon EC2 instances in multiple Availability Zones behind an internal Application Load Balancer (ALB). The company's clients connect from the on-premises network by using HTTPS. The TLS terminates in the ALB. The company has multiple target groups and uses path-based routing to forward requests based on the URL path.

The company is planning to deploy an on-premises firewall appliance with an allow list that is based on IP address. A solutions architect must develop a solution to allow traffic flow to AWS from the on-premises network so that the clients can continue to access the application.

Which solution will meet these requirements?

- A. Create a Network Load Balancer (NLB). Associate the NLB with one static IP addresses in multiple Availability Zones. Add the existing target groups to the NLB. Update the clients to connect to the NLB. Delete the ALB Add the NLB IP addresses to the firewall appliance.
- B. Create a Network Load Balancer (NLB). Associate the NLB with one static IP addresses in multiple Availability Zones. Create an ALB-type target group for the NLB and add the existing ALB Add the NLB IP addresses to the firewall appliance. Update the clients to connect to the NLB.
- C. Create a Gateway Load Balancer (GWLB). Assign static IP addresses to the GWLB in multiple Availability Zones. Create an ALB-type target group for the GWLB and add the existing ALB. Add the GWLB IP addresses to the firewall appliance. Update the clients to connect to the GWLB.
- D. Configure the existing ALB to use static IP addresses. Assign IP addresses in multiple Availability Zones to the ALB. Add the ALB IP addresses to the firewall appliance.

Answer: B

Explanation:

Explanation

The company should create a Network Load Balancer (NLB) and associate it with one static IP address in multiple Availability Zones. The company should also create an ALB-type target group for the NLB and add the existing ALB. The company should add the NLB IP addresses to the firewall appliance and update the clients to connect to the NLB. This solution will allow traffic flow to AWS from the on-premises network by using static IP addresses that can be added to the firewall appliance's allow list. The NLB will forward requests to the ALB, which will use path-based routing to forward requests to the target groups.

NEW QUESTION # 171

A company is migrating a document processing workload to AWS. The company has updated many applications to natively use the Amazon S3 API to store, retrieve, and modify documents that a processing server generates at a rate of approximately 5 documents every second. After the document processing is finished, customers can download the documents directly from Amazon S3.

During the migration, the company discovered that it could not immediately update the processing server that generates many documents to support the S3 API. The server runs on Linux and requires fast local access to the files that the server generates and modifies. When the server finishes processing, the files must be available to the public for download within 30 minutes.

Which solution will meet these requirements with the LEAST amount of effort?

- A. Set up an Amazon S3 File Gateway and configure a file share that is linked to the document store. Mount the file share on an Amazon EC2 instance by using NFS. When changes occur in Amazon S3, initiate a RefreshCache API call to update the S3 File Gateway.
- B. Configure Amazon FSx for Lustre with an import and export policy. Link the new file system to an S3 bucket. Install the Lustre client and mount the document store to an Amazon EC2 instance by using NFS.
- C. Configure AWS DataSync to connect to an Amazon EC2 instance. Configure a task to synchronize the generated files to and from Amazon S3.
- D. Migrate the application to an AWS Lambda function. Use the AWS SDK for Java to generate, modify, and access the files that the company stores directly in Amazon S3.

Answer: A

Explanation:

amazon FSx for lustre does NOT suport nfs file system!

NEW QUESTION # 172

A company is using a single AWS Region for its ecommerce website. The website includes a web application that runs on several

Amazon EC2 instances behind an Application Load Balancer (ALB).

The website also includes an Amazon DynamoDB table. A custom domain name in Amazon Route 53 is linked to the ALB. The company created an SSL/TLS certificate in AWS Certificate Manager (ACM) and attached the certificate to the ALB. The company is not using a content delivery network as part of its design. The company wants to replicate its entire application stack in a second Region to provide disaster recovery, plan for future growth, and provide improved access time to users. A solutions architect needs to implement a solution that achieves these goals and minimizes administrative overhead. Which combination of steps should the solutions architect take to meet these requirements?

(Select THREE.)

- A. Update the Route 53 hosted zone record for the application to use latency-based routing. Send traffic to the ALB in each Region.
- B. Create a new DynamoDB table. Enable DynamoDB Streams for the new table. Add the second Region to create a global table. Copy the data from the existing DynamoDB table to the new table as a one-time operation.
- C. Create an AWS CloudFormation template for the current infrastructure design. Use parameters for important system values, including Region. Use the CloudFormation template to create the new infrastructure in the second Region.
- D. Use the AWS Management Console to document the existing infrastructure design in the first Region and to create the new infrastructure in the second Region.
- E. Update the Route 53 hosted zone record for the application to use weighted routing. Send 50% of the traffic to the ALB in each Region.
- F. Update the configuration of the existing DynamoDB table by enabling DynamoDB Streams. Add the second Region to create a global table.

Answer: A,C,F

Explanation:

Comprehensive and Detailed Explanation:

* A. Using AWS CloudFormation templates allows for the automation of infrastructure deployment. By parameterizing the templates, resources can be provisioned consistently across multiple Regions, reducing administrative overhead and ensuring infrastructure as code practices.

* D. Amazon Route 53 latency-based routing directs user requests to the AWS Region that provides the lowest latency, improving access times for users globally and enhancing the user experience.

* E. Enabling DynamoDB Streams and adding a second Region to create a global table ensures that data is replicated across Regions, providing high availability and disaster recovery capabilities.

This combination of steps ensures that the application stack is replicated efficiently across Regions, providing disaster recovery, improved performance, and scalability, all while minimizing manual administrative tasks.

References:

AWS CloudFormation: Enables modeling and setting up AWS resources so that you can spend less time managing those resources and more time focusing on your applications.

Amazon Route 53 Latency-Based Routing: Helps improve performance for your global applications by serving user requests from the AWS Region that provides the lowest latency.

Amazon DynamoDB Global Tables: Provides a fully managed, multi-Region, and multi-active database that delivers fast and local read and write performance for massively scaled, global applications.

NEW QUESTION # 173

A company is using multiple AWS accounts. The company has a shared services account and several other accounts (or different projects).

A team has a VPC in a project account. The team wants to connect this VPC to a corporate network through an AWS Direct Connect gateway that exists in the shared services account. The team wants to automatically perform a virtual private gateway association with the Direct Connect gateway by using an already-tested AWS Lambda function while deploying its VPC networking stack. The Lambda function code can assume a role by using AWS Security Token Service (AWS STS). The team is using AWS Cloud Formation to deploy its infrastructure.

Which combination of steps will meet these requirements? (Select THREE.)

- A. Create a cross-account IAM role in the shared services account that grants the sts: AssumeRole permission to the Lambda function with the directconnect:" permission acting as a resource. Add the sts AssumeRole permission with this cross-account IAM role as a resource to the IAM role that belongs to the Lambda function in the project account.
- B. Deploy the Lambda function to the project account. Update the Lambda function's IAM role with the directconnect:* permission
- C. Create a cross-account IAM role in the shared services account that grants the Lambda function the directconnect:" permission. Add the sts:AssumeRole permission to the IAM role that is associated with the Lambda function in the shared

services account.

- D. Add a custom resource to the Cloud Formation networking stack that Reference the Lambda function in the project account.
- E. Deploy the Lambda function that is performing the association to the shared services account. Update the Lambda function's IAM role with the directconnect: permission.
- F. Add a custom resource to the Cloud Formation networking stack that Reference the Lambda function in the shared services account.

Answer: A,C,D

NEW QUESTION # 174

A company runs a new application as a static website in Amazon S3. The company has deployed the application to a production AWS account and uses Amazon CloudFront to deliver the website. The website calls an Amazon API Gateway REST API. An AWS Lambda function backs each API method.

The company wants to create a CSV report every 2 weeks to show each API Lambda function's recommended configured memory, recommended cost, and the price difference between current configurations and the recommendations. The company will store the reports in an S3 bucket.

Which solution will meet these requirements with the LEAST development time?

- A. Purchase the AWS Business Support plan for the production account. Opt in to AWS Compute Optimizer for AWS Trusted Advisor checks. In the Trusted Advisor console, schedule a job to export the cost optimization checks to a _csvfile_ Store the file in an S3 bucket every 2 weeks.
- B. Create a Lambda function that extracts metrics data for each API Lambda function from Amazon CloudWatch Logs for the 2-week period_ Collate the data into tabular format. Store the data as a _csvfile in an S3 bucket. Create an Amazon Eventbridge rule to schedule the Lambda function to run every 2 weeks.
- C. Opt in to AWS Compute Optimizer. Create a Lambda function that calls the ExportLambdaFunctionRecommendatons operation. Export the _csv file to an S3 bucket. Create an Amazon Eventbridge rule to schedule the Lambda function to run every 2 weeks.
- D. Opt in to AWS Compute Optimizer. Set up enhanced infrastructure metrics. Within the Compute Optimizer console, schedule a job to export the Lambda recommendations to a _csvfile_ Store the file in an S3 bucket every 2 weeks.

Answer: C

Explanation:

https://docs.aws.amazon.com/compute-optimizer/latest/APIReference/API_ExportLambdaFunctionRecommendations

NEW QUESTION # 175

.....

The online version of our SAP-C02 exam questions can apply to all kinds of electronic devices, such as the IPAD, phone and laptop. And this version of our SAP-C02 training guide is convenient for you if you are busy at work and traffic. Wherever you are, as long as you have an access to the internet, a smart phone or an I-pad can become your study tool for the SAP-C02 Exam. Isn't it a good way to make full use of fragmentary time?
