

Databricks-Certified-Data-Engineer-Associate Prüfungssimulationen - Databricks-Certified-Data-Engineer-Associate Zertifizierungsprüfung

Laden Sie die neuesten It-Prüfung Databricks-Certified-Data-Engineer-Associate PDF-Versionen von Prüfungsfragen kostenlos von Google Drive herunter: https://drive.google.com/open?id=1W4nauca4qRTfKFP5_QG2L1gH2zbjAeiK

It-Prüfung wird Ihnen stets begleiten, bis Sie erfolgreich werden. Egal wie ehrgeizig Ihre Träume sind, werden wir It-Prüfung Ihnen helfen, Ihre Träume Schritt für Schritt zu verwirklichen. Denn unsere Schulungsunterlagen zur Databricks Databricks-Certified-Data-Engineer-Associate Zertifizierungsprüfung sind von erfahrenen IT-Experten durch ihre eigene ständige Untersuchungen und Erforschungen bearbeitet. Wenn Sie noch damit zögern, können Sie vorher einige kostenlosen Testaufgaben und Antworten auf der Webseite It-Prüfung als Probe herunterladen. Wir sind sicher, dass Sie niemals enttäuscht werden.

Wenn Sie Dumps zur Databricks Databricks-Certified-Data-Engineer-Associate Zertifizierungsprüfung von It-Prüfung kaufen, versprechen wir Ihnen, dass Sie 100% die Databricks Databricks-Certified-Data-Engineer-Associate Zertifizierungsprüfung bestehen können. Sonst zahlen wir Ihnen die gesamte Summe zurück.

Databricks Databricks-Certified-Data-Engineer-Associate Zertifizierungsprüfung - Databricks-Certified-Data-Engineer-Associate Fragen Beantworten

It-Prüfung wird nicht nur Ihren Wunsch erfüllen, sondern Ihnen einen einjährigen kostenlosen Update-Service und Kundendienst bieten. Die Prüfungsfragen von It-Prüfung sind alle richtig, die Ihnen beim Bestehen der Databricks Databricks-Certified-Data-Engineer-Associate Zertifizierungsprüfung helfen. Im It-Prüfung können Sie kostenlos einen Teil der Fragen und Antworten zur Databricks Databricks-Certified-Data-Engineer-Associate Zertifizierungsprüfung als Probe herunterladen.

Databricks Certified Data Engineer Associate Exam Databricks-Certified-Data-Engineer-Associate Prüfungsfragen mit Lösungen (Q100-Q105):

100. Frage

A data engineer has been using a Databricks SQL dashboard to monitor the cleanliness of the input data to an ELT job. The ELT job has its Databricks SQL query that returns the number of input records containing unexpected NULL values. The data engineer wants their entire team to be notified via a messaging webhook whenever this value reaches 100.

Which of the following approaches can the data engineer use to notify their entire team via a messaging webhook whenever the number of NULL values reaches 100?

- A. They can set up an Alert without notifications.
- **B. They can set up an Alert with a new webhook alert destination.**
- C. They can set up an Alert with one-time notifications.
- D. They can set up an Alert with a custom template.
- E. They can set up an Alert with a new email alert destination.

Antwort: B

Begründung:

A webhook alert destination is a way to send notifications to external applications or services via HTTP requests. A data engineer can use a webhook alert destination to notify their entire team via a messaging webhook, such as Slack or Microsoft Teams, whenever the number of NULL values in the input data reaches

100. To set up a webhook alert destination, the data engineer needs to do the following steps:

- * In the Databricks SQL workspace, navigate to the Settings gear icon and select SQL Admin Console.
- * Click Alert Destinations and click Add New Alert Destination.
- * Select Webhook and enter the webhook URL and the optional custom template for the notification message.
- * Click Create to save the webhook alert destination.
- * In the Databricks SQL editor, create or open the query that returns the number of input records containing unexpected NULL values.
- * Click the Create Alert icon above the editor window and configure the alert criteria, such as the value column, the condition, and the threshold.
- * In the Notification section, select the webhook alert destination that was created earlier and click Create Alert. References: What are Databricks SQL alerts?, Monitor alerts, Monitoring Your Business with Alerts, Using Automation Runbook Webhooks To Alert on Databricks Status Updates.

101. Frage

An engineering manager wants to monitor the performance of a recent project using a Databricks SQL query. For the first week following the project's release, the manager wants the query results to be updated every minute. However, the manager is concerned that the compute resources used for the query will be left running and cost the organization a lot of money beyond the first week of the project's release.

Which of the following approaches can the engineering team use to ensure the query does not cost the organization any money beyond the first week of the project's release?

- **A. They can set the query's refresh schedule to end on a certain date in the query scheduler.**
- B. They can set a limit to the number of individuals that are able to manage the query's refresh schedule.
- C. They can set a limit to the number of DBUs that are consumed by the SQL Endpoint.
- D. They cannot ensure the query does not cost the organization money beyond the first week of the project's release.
- E. They can set the query's refresh schedule to end after a certain number of refreshes.

Antwort: A

Begründung:

In Databricks SQL, you can use scheduled query executions to update your dashboards or enable routine alerts. By default, your queries do not have a schedule. To set the schedule, you can use the dropdown pickers to specify the frequency, period, starting time, and time zone. You can also choose to end the schedule on a certain date by selecting the End date checkbox and picking a date from the calendar. This way, you can ensure that the query does not run beyond the first week of the project's release and does not incur any additional cost. Option A is incorrect, as setting a limit to the number of DBUs does not stop the query from running. Option B is incorrect, as there is no option to end the schedule after a certain number of refreshes. Option C is incorrect, as there is a way to ensure the query does not cost the organization money beyond the first week of the project's release. Option D is incorrect, as setting a limit to the number of individuals who can manage the query's refresh schedule does not affect the query's execution or cost. Reference: Schedule a query, Schedule a query - Azure Databricks - Databricks SQL

102. Frage

A data engineer has developed a data pipeline to ingest data from a JSON source using Auto Loader, but the engineer has not provided any type inference or schema hints in their pipeline. Upon reviewing the data, the data engineer has noticed that all of the columns in the target table are of the string type despite some of the fields only including float or boolean values.

Which of the following describes why Auto Loader inferred all of the columns to be of the string type?

- **A. JSON data is a text-based format**

- B. Auto Loader only works with string data
- C. All of the fields had at least one null value
- D. There was a type mismatch between the specific schema and the inferred schema
- E. Auto Loader cannot infer the schema of ingested data

Antwort: A

Begründung:

JSON data is a text-based format that represents data as a collection of name-value pairs. By default, when Auto Loader infers the schema of JSON data, it treats all columns as strings. This is because JSON data can have varying data types for the same column across different files or records, and Auto Loader does not attempt to reconcile these differences. For example, a column named "age" may have integer values in some files, but string values in others. To avoid data loss or errors, Auto Loader infers the column as a string type.

However, Auto Loader also provides an option to infer more precise column types based on the sample data.

This option is called `cloudFiles.inferColumnTypes` and it can be set to true or false. When set to true, Auto Loader tries to infer the exact data types of the columns, such as integers, floats, booleans, or nested structures. When set to false, Auto Loader infers all columns as strings. The default value of this option is false. References: Configure schema inference and evolution in Auto Loader, Schema inference with auto loader (non-DLT and DLT), Using and Abusing Auto Loader's Inferred Schema, Explicit path to data or a defined schema required for Auto loader.

103. Frage

An engineering manager uses a Databricks SQL query to monitor ingestion latency for each data source. The manager checks the results of the query every day, but they are manually rerunning the query each day and waiting for the results.

Which of the following approaches can the manager use to ensure the results of the query are updated each day?

- **A. They can schedule the query to refresh every 1 day from the query's page in Databricks SQL.**
- B. They can schedule the query to refresh every 12 hours from the SQL endpoint's page in Databricks SQL.
- C. They can schedule the query to run every 1 day from the Jobs UI.
- D. They can schedule the query to refresh every 1 day from the SQL endpoint's page in Databricks SQL.
- E. They can schedule the query to run every 12 hours from the Jobs UI.

Antwort: A

Begründung:

Explanation

104. Frage

In order for Structured Streaming to reliably track the exact progress of the processing so that it can handle any kind of failure by restarting and/or reprocessing, which of the following two approaches is used by Spark to record the offset range of the data being processed in each trigger?

- A. Checkpointing and Idempotent Sinks
- **B. Checkpointing and Write-ahead Logs**
- C. Write-ahead Logs and Idempotent Sinks
- D. Structured Streaming cannot record the offset range of the data being processed in each trigger.
- E. Replayable Sources and Idempotent Sinks

Antwort: B

Begründung:

Structured Streaming uses checkpointing and write-ahead logs to record the offset range of the data being processed in each trigger. This ensures that the engine can reliably track the exact progress of the processing and handle any kind of failure by restarting and/or reprocessing. Checkpointing is the mechanism of saving the state of a streaming query to fault-tolerant storage (such as HDFS) so that it can be recovered after a failure. Write-ahead logs are files that record the offset range of the data being processed in each trigger and are written to the checkpoint location before the processing starts. These logs are used to recover the query state and resume processing from the last processed offset range in case of a failure. Reference: Structured Streaming Programming Guide, Fault Tolerance Semantics

105. Frage
