1z1-076 Exam Questions & 1z1-076 Study Materials & 1z1-076 Dumps Torrent

DOWNLOAD the newest ITdumpsfree 1z1-076 PDF dumps from Cloud Storage for free: https://drive.google.com/open?id=1gwijZvgbatdxNBG2Oho-kIvJkvZ42bct

As an authorized website, ITdumpsfree provide you with the products that can be utilized most efficiently. We provide 24/7 customer service for all of you, please feel free to send us any questions about Oracle exam test through email or online chat, and we will always try our best to keeping our customer satisfied. 1z1-076 Study Material will give you a better way to prepare for the actual test with its validity and reliability 1z1-076 questions & answers. Now, please choose our 1z1-076 dumps torrent for your 100% passing.

Oracle 1z1-076 Exam Syllabus Topics:

Topic	Details
Topic 1	• Creating a Logical Standby Database: This topic guides users through the process of creating and managing a logical standby database, including SQL Apply filtering.
Topic 2	• Monitoring a Data Guard Broker Configuration: The topic covers the use of Enterprise Manager and DGMGRL to monitor Data Guard configurations and explains the various data protection modes available.
Topic 4	• Backup and Recovery Considerations in an Oracle Data Guard Configuration: In this topic, Backup and recovery procedures in a Data Guard configuration are discussed, including RMAN backups, offloading to physical standby, and network-based recovery.
Topic 5	• Creating a Data Guard Broker Configuration: This section delves into the practical aspects of creating and managing a Data Guard broker configuration, including command-line and Enterprise Manager approaches.
Topic 6	• Oracle Data Guard Broker Basics: An overview of the Data Guard broker, its architecture, components, benefits, and configurations, is provided here. It serves as an introduction to the tool used for managing Data Guard configurations.
Topic 7	• Managing Oracle Net Services in a Data Guard Environment: The section focuses on Oracle Net Services and its role in Data Guard networking setup.
Topic 8	• Oracle Data Guard Basics: This topic covers the essential architecture and concepts of Oracle Data Guard. It includes sub-topics such as the physical and logical standby database comparison, benefits of Data Guard, and its integration with multi-tenant databases.

Topic 9	• Using Oracle Active Data Guard: Supported Workloads in Read-Only Standby Databases: Here, the usage of physical standby databases for real-time queries is discussed.
Topic 10	• Patching and Upgrading Databases in a Data Guard Configuration: This section provides guidance on patching and upgrading databases in a Data Guard environment, along with performance optimization techniques and monitoring considerations.

Practice 1z1-076 Test Engine - 1z1-076 Reliable Braindumps Sheet

We have authoritative production team made up by thousands of experts helping you get hang of our 1z1-076 study question and enjoy the high quality study experience. We will update the content of 1z1-076 test guide from time to time according to recent changes of examination outline and current policies. Besides, our 1z1-076 Exam Questions can help you optimize your learning method by simplifying obscure concepts so that you can master better. One more to mention, with our 1z1-076 test guide, there is no doubt that you can cut down your preparing time in 20-30 hours of practice before you take the exam.

Oracle Database 19c: Data Guard Administration Sample Questions (Q57-Q62):

NEW QUESTION # 57
Which three types of backups offload .... with the primary database in a data Guard

- A. Online logs
- B. Password files
- C. Control files
- D. Data files
- E. Broker configuration files
- F. Archive logs

Answer: C,D,F

Explanation:
In a Data Guard environment, you can offload the backups of certain database components to a physical standby database. Incremental backups of a standby database are interchangeable with the primary database, meaning you can apply a backup taken on a standby database to a primary database and vice versa. This includes control files, data files, and archive logs. Backups of control files and nonstandby control files are interchangeable. You can restore a standby control file on a primary database and a primary control file on a physical standby database, demonstrating their interchangeability and the ability to offload control file backups to one database in a Data Guard environment.

NEW QUESTION # 58
You detected an unrecoverable archive gap in your data guard environment. So, you need to roll standby.
forward in time without applying a large number of archive log files using this command:
RMAN> RECOVER STANDBY DATABASE FROM SERVICE-<primary database name>;
When running this command, which of the following steps can be performed automatically?
1. Remember all data file names on the standby.
2. Restart standby in nomount.
3. Restore controlfile from primary.
4. Mount standby database.
5. Rename data files from stored standby names.
6. Restore new data files to new names.
7. Recover standby.

- A. 1,2,3,4,5,6,7
- B. 2,3,6,7
- C. 1,3,5,6,7

- D. 2,3,5,6,7
- E. 1, 2,3,4,6,7

Answer: E

Explanation:
The RECOVER STANDBY DATABASE FROM SERVICE command in RMAN is designed to automate various steps required to recover the standby database, especially when dealing with an archive gap. When this command is executed, the following actions can occur automatically:
* Remember all data file names on the standby (1): RMAN has the capability to recall the names and paths of all data files associated with the standby database.
* Restart standby in nomount (2): The standby database can be automatically restarted in the NOMOUNT state, allowing recovery operations to proceed without the database being open.
* Restore controlfile from primary (3): RMAN can restore the control file from the primary database to the standby system, ensuring that the standby has the most up-to-date control file.
* Mount standby database (4): After restoring the control file, the standby database is mounted to prepare for data file recovery.
* Rename data files from stored standby names (5): Not typically done automatically by this command.
* Restore new data files to new names (6): New data files added to the primary since the last synchronization can be restored to the standby with their correct names.
* Recover standby (7): Finally, RMAN will apply any necessary redo logs to bring the standby database up to date with the primary.
While some steps, such as renaming data files (5), typically require manual intervention or scripting, most of the recovery process can be handled by RMAN automatically, streamlining the recovery of the standby database.

NEW QUESTION # 59
A customer asks for your recommendation regarding this requirement:
1. We plan to have a Data Guard Configuration with one primary database and one physical standby database.
2. We want zero data loss in case of a disaster involving the loss of one component.
3. We want to do Real Application Testing occasionally on the Standby Database.
Which solution, if any, satisfies these requirements?

- A. A physical standby database with synchronous redo transport that can be converted regularly into a snapshot standby to do real application testing
- B. A far sync instance plus a snapshot standby database and real time apply that can be converted regularly into logical standby database to do real application testing
- C. These requirements cannot be met.
- D. A snapshot standby database with real time query that can be converted regularly into a physical standby database open read write, to do real application testing

Answer: A

Explanation:
* Synchronous redo transport for zero data loss (B): To guarantee zero data loss in the case of a disaster, synchronous redo transport must be configured between the primary and standby databases.
* Conversion to snapshot standby for testing (B): A physical standby database can be temporarily converted into a snapshot standby database to perform real application testing. After testing is completed, the snapshot standby can be converted back to a physical standby to resume its disaster recovery role.

NEW QUESTION # 60
Which THREE are among the various tasks performed by the Data Guard Monitor (DMON) process?

- A. communicating with the DMON process of the observer to monitor a primary database in case a fast start failover is required

- B. communicating with dkon processes in other database instances that are part of the broker configuration
- C. activating role-based services appropriately in the various database instances of the configuration, based on the database role
- D. maintaining information about all members of the broker configuration in binary configuration files.
- E. performing role transitions when switchover requests are made

Answer: C,D,E

Explanation:
The Data Guard Monitor (DMON) process is a key component of Oracle Data Guard. It plays a crucial role in managing and monitoring the state of both the primary and standby databases in a Data Guard configuration.
Performing role transitions when switchover requests are made (A): DMON is responsible for coordinating the switchover process between the primary and standby databases. This involves safely transitioning the roles of the databases to ensure data protection and availability.
Maintaining information about all members of the broker configuration in binary configuration files (B): DMON maintains detailed information about the databases in the Data Guard configuration, including their roles, states, and network addresses. This information is stored in binary configuration files, which are used by the Data Guard Broker to manage the Data Guard environment.
Activating role-based services appropriately in the various database instances of the configuration, based on the database role (C): DMON activates services that are appropriate for the role of each database in the Data Guard configuration. For example, it may activate different services on a primary database than on a standby database, based on the specific requirements of each role.

NEW QUESTION # 61
In Oracle Database 19c, you can set the value of database initialization parameters in a database using the EDIT DATABASE...
SET PARAMETER Command:
DGMGRL> EDIT DATABASE 'boston' SET PARAMETER log_archive_trace - 1;
Which THREE statements are TRUE about the command?

- A. The database must be available when the above command is run.
- B. The EDIT DATABASE PARAMETER command can be used to set the value of a static parameter in a database.
- C. The edit database parameter command can only be used to modify the value of a dynamic parameter in a database.
- D. The value set using this command is directly stored in the broker configuration file.
- E. The value set using this command is directly applied to the boston database.

Answer: A,C,E

Explanation:
The EDIT DATABASE...SET PARAMETER command in Data Guard Management (DGMGRL) is used to modify the value of initialization parameters for a database within a Data Guard configuration. This command can be used to modify both static and dynamic parameters, but if a static parameter is changed, the new value will take effect only after the database is restarted. The database must be up and running for the command to execute, and the values set using the command are directly applied to the specified database (in this case, 'boston') .
