AWS Certified Developer – Associate (DVA-C01)
Sample Exam Questions

1) A company is migrating a legacy application to Amazon EC2. The application uses a user name and password stored in the source code to connect to a MySQL database. The database will be migrated to an Amazon RDS for MySQL DB instance. As part of the migration, the company wants to implement a secure way to store and automatically rotate the database credentials.

Which approach meets these requirements?

- A) Store the database credentials in environment variables in an Amazon Machine Image (AMI). Rotate the credentials by replacing the AMI.
- B) Store the database credentials in AWS Systems Manager Parameter Store. Configure Parameter Store to automatically rotate the credentials.
- C) Store the database credentials in environment variables on the EC2 instances. Rotate the credentials by relaunching the EC2 instances.
- D) Store the database credentials in AWS Secrets Manager. Configure Secrets Manager to automatically rotate the credentials.

Amazon AWS-Developer (AWS Certified Developer - Associate) certification exam is a highly sought after certification for

individuals looking to validate their skills and proficiency in developing applications on the Amazon Web Services (AWS) platform. AWS Certified Developer Associate Exam (DVA-C02) certification validates an individual's ability to design, deploy, and maintain AWS applications using AWS services and tools.

Amazon AWS Certified Developer Associate Exam (DVA-C02) Sample Questions (Q236-Q241):

NEW QUESTION # 236

An organization is storing large files in Amazon S3, and is writing a web application to display meta-data about the files to end-users. Based on the metadata a user selects an object to download. The organization needs a mechanism to index the files and provide single-digit millisecond latency retrieval for the metadata.

What AWS service should be used to accomplish this?

- A. Amazon DynamoDB
- B. Amazon EC2
- C. AWS Lambda
- D. Amazon RDS

Answer: A

NEW QUESTION # 237

A company has three different environments: Development, QA, and Production. The company wants to deploy its code first in the Development environment, then QA, and then Production.

Which AWS service can be used to meet this requirement?

- A. Use AWS CodeDeploy to create multiple deployment groups.
- B. Use AWS Data Pipeline to create multiple data pipeline provisions to deploy the application.
- C. Use AWS CodeCommit to create multiple repositories to deploy the application.
- D. Use AWS CodeBuild to create, configure, and deploy multiple build application projects.

Answer: A

Explanation:

<https://docs.aws.amazon.com/codedeploy/latest/userguide/deployment-groups.html>

"You can associate more than one deployment group with an application in CodeDeploy. This makes it possible to deploy an application revision to different sets of instances at different times. For example, you might use one deployment group to deploy an application revision to a set of instances tagged Test where you ensure the quality of the code. Next, you deploy the same application revision to a deployment group with instances tagged Staging for additional verification. Finally, when you are ready to release the latest application to customers, you deploy to a deployment group that includes instances tagged Production. "

NEW QUESTION # 238

A Developer needs to design an application running on AWS that will be used to consume Amazon SQS messages that range from 1 KB up to 1GB in size.

How should the Amazon SQS messages be managed?

- A. Use Amazon S3 and the Amazon SQS Extended Client Library for Java.
- B. Use Amazon EFS and the Amazon SQS CLI.
- C. Use Amazon S3 and the Amazon SQS CLI.
- D. Use Amazon EBS and the Amazon SQS CLI.

Answer: A

Explanation:

NEW QUESTION # 239

Your company decides to use Amazon S3 to augment its on-premises data store. Instead of using the

company's highly controlled, on-premises Internet gateway, a Direct Connect connection is ordered to provide high bandwidth, low latency access to S3. Since the company does not own a publically routable IPv4 address block, a request was made to AWS for an AWS-owned address for a Public Virtual Interface (VIF).

The security team is calling this new connection a "backdoor", and you have been asked to clarify the risk to the company.

Which concern from the security team is valid and should be addressed?

- A. Direct Connect customers with a Public VIF in the same region could directly reach the router.
- **B. AWS advertises its aggregate routes to the Internet allowing anyone on the Internet to reach the router.**
- C. EC2 instances in the same region with access to the Internet could directly reach the router.
- D. The S3 service could reach the router through a pre-configured VPC Endpoint.

Answer: B

NEW QUESTION # 240

A Developer implemented a static website hosted in Amazon S3 that makes web service requests hosted in Amazon API Gateway and AWS Lambda. The site is showing an error that reads:

"No 'Access-Control-Allow-Origin' header is present on the requested resource. Origin 'null' is therefore not allowed access."

What should the Developer do to resolve this issue?

- A. Enable cross-origin resource sharing (CORS) on the S3 bucket.
- B. Add the Access-Control-Request-Method header to the request
- **C. Enable cross-origin resource sharing (CORS) for the method in API Gateway**
- D. Add the Access-Control-Request-Headers header to the request

Answer: C
