## WGU Cloud Deployment and Operations Sample Questions (Q52-Q57):

### NEW QUESTION # 52

(How are custom metrics grouped in CloudWatch?)

- A. Date
- **B. Namespace**
- C. Value
- D. Service

**Answer: B**

Explanation:

In Amazon CloudWatch, custom metrics are organized and grouped using namespaces. A namespace is a container for CloudWatch metrics that allows you to isolate and categorize metrics from different applications or services. According to the WGU Cloud Deployment and Operations Study Guide (Section 4.1, CloudWatch Metrics), each custom metric must be assigned to a namespace, which acts as a unique identifier to prevent naming collisions and facilitate metric management. Options like Service, Date, and Value are not used for grouping metrics in this context.

### NEW QUESTION # 53

(What is the role of AWS Trusted Advisor?)

- A. It provides recommendations on patches to be performed on resources.
- B. It provides a holistic overview of the health of architecture.
- C. It provides an assessment on unused IAM roles.
- **D. It provides recommendations to help follow AWS best practices.**

**Answer: D**

Explanation:

AWS Trusted Advisor provides recommendations to help follow AWS best practices, analyzing the environment for cost optimization, security, performance, and fault tolerance. It offers actionable insights to improve resource usage. The WGU Cloud Deployment and Operations Study Guide (Section 6.4, Trusted Advisor) states, "Trusted Advisor evaluates your AWS environment against best practices, providing recommendations in categories like cost optimization and security (e.g., enabling MFA or removing unused resources)." Options A, B, and C overstate or misrepresent its role, as it does not focus solely on unused IAM roles, holistic health overviews, or patch recommendations.

### NEW QUESTION # 54

(What is the role of a patch baseline in Patch Manager?)

- **A. Defines patches that should and should not be installed on EC2 instances**
- B. Installs all patch updates as they become available by default
- C. Notifies Config of any patch updates that need to be performed
- D. Assigns an IAM role for services that can auto-approve patches upon release

**Answer: A**

Explanation:

A patch baseline in Patch Manager defines the patches that should and should not be installed on EC2 instances, specifying approval rules for security updates, other updates, and exclusions. This ensures controlled and compliant patching. The WGU Cloud Deployment and Operations Study Guide (Section 5.2, Patch Manager) states, "A patch baseline specifies which patches are

approved for installation and which are excluded, allowing customization of patch deployment (e.g., approving only critical security updates)." Options A, B, and D misrepresent the baseline's role, as it does not auto-install, assign IAM roles, or notify Config directly.

#### NEW QUESTION # 55

(A company manages a containerized application by manually deploying AWS compute instances. Which solution should be used to optimize the cost of the application?)

- A. Fargate
- B. RDS
- C. EFS
- D. Aurora

**Answer: A**

Explanation:

AWS Fargate should be used to optimize the cost of a containerized application by eliminating the need for manual instance management, as it provides serverless container orchestration that automatically scales and charges only for resource usage. The WGU Cloud Deployment and Operations Study Guide (Section 7.5, Fargate) states, "Fargate optimizes costs for containerized applications by removing the overhead of managing EC2 instances, scaling automatically, and billing based on vCPU and memory usage, reducing manual deployment expenses." Aurora, RDS, and EFS are database or storage solutions not designed for container cost optimization.

#### NEW QUESTION # 56

(An administrator needs to create Systems Manager Automation documents to take action based on AWS Config rules. Which two file formats should be used? Choose 2 answers.)

- A. YAML
- B. CSV
- C. XML
- D. JSON

**Answer: A,D**

Explanation:

Systems Manager Automation documents can be created using JSON or YAML file formats to define workflows and actions based on AWS Config rules. These formats allow administrators to specify the steps and parameters for automation tasks, such as remediation actions triggered by Config rule evaluations. The WGU Cloud Deployment and Operations Study Guide (Section 5.1, Systems Manager Automation) states that both JSON and YAML are supported formats for writing Automation documents, providing flexibility in scripting automation logic. XML and CSV are not supported formats for this purpose.
