최신 Salesforce Accredited Professional AP-219 무료샘플문제 (Q12-Q17):

질문 # 12

Once the administrator has activated the integration between B2C Commerce and Order Management, orders being placed by customers will be sent to Order Management if the order status is set to which two values?

- A. Drafted
- B. Active
- C. Created
- D. Open
- E. New

정답: B,E

설명:

Once the administrator has activated the integration between B2C Commerce and Order Management, orders being placed by customers will be sent to Order Management if the order status is set to Active or New. These are the two order statuses that indicate that an order has been created or confirmed by a customer, and that it needs to be processed by Order Management. 질문 # 13

An administrator needs to import Order Summary records containing historical data but does not want them to be actioned on by Order Management. Which feature supports this use case?

- A. Unmanaged Order Checkbox
- B. Order Management Type Picklist
- C. Custom checkbox
- D. Order Life Cycle Type Picklist

정답: A

설명:

The feature that supports this use case is the Unmanaged Order Checkbox. This is a standard field on the Order Summary object that indicates whether the order is managed by Order Management or not. If this field is checked, then the order is not actioned on by Order Management, and it does not trigger any flows or processes. The administrator can use this field to import Order Summary records containing historical data without affecting the order lifecycle. 질문 # 14

What are two items that an administrator should consider when building out a flow for one location vs multiple locations?

- A. Having multiple locations mandates writing custom Apex code
- B. Multiple locations can lead to limit exceptions
- C. A default warehouse location should be set first in flows handling multiple locations
- D. Multiple locations will introduce nested loops which can make the canvas substantially larger

정답: B,D

설명:

When building a flow for multiple locations, an administrator should consider the following challenges:

Multiple locations will introduce nested loops which can make the canvas substantially larger. For example, a flow that handles multiple fulfillment orders per order and multiple fulfillment order lines per fulfillment order will need to loop through both levels of records. This can make the flow more complex and harder to maintain.

Multiple locations can lead to limit exceptions. For example, a flow that queries or updates a large number of records across multiple locations may hit the SOQL query limit or the DML statement limit. To avoid this, an administrator should use bulkified actions and optimize the flow performance. Reference: Order Fulfillment Flows, [Flow Performance Best Practices]

질문 # 15

How can an administrator quickly examine the relationships between several objects?

- A. File a support case asking for a data relationship diagram
- B. Goto SchemaBuilder and check the boxes next to the objectnames
- C. Generate an Entity Relationship Diagram by going to Data in Setup
- D. Download it from the Partner Community

정답: B

설명:

The best way for an administrator to quickly examine the relationships between several objects is to go to Schema Builder and check the boxes next to the object names. Schema Builder is a tool that allows administrators to view and modify the data model of their org in a graphical interface. Schema Builder shows the objects and fields in the org, as well as the relationships between them. The administrator can use Schema Builder to select the objects that they want to examine, and see how they are connected to each other. 질문 # 16

Which two Order Management objects have their tabs set to Tab Hidden by default?

- A. OrderDeliveryMethod
- B. SalesLocation
- C. Locations
- D. Accounts
- E. Fulfillment Orders

정답: A,C

설명:

The OrderDeliveryMethod and Locations objects have their tabs set to Tab Hidden by default. These objects are used to store information about how an order is delivered and where it is fulfilled from, respectively. They are not meant to be accessed directly by users, but rather through related lists or lookup fields on other objects. Reference: Order Management Objects
