2026 Managing-Cloud-Security Popular Exams Pass Certify | High-quality Managing-Cloud-Security New Questions: WGU Managing Cloud Security (JY02)

The internet is transforming society, and distance is no longer an obstacle. You can download our Managing-Cloud-Security exam simulation from our official website, which is a professional platform providing the most professional Managing-Cloud-Security practice materials. You can get them within 15 minutes without waiting. What is more, you may think these high quality Managing-Cloud-Security Preparation materials require a huge investment on them. Actually we eliminate the barriers blocking you from our Managing-Cloud-Security practice materials. The price of our Managing-Cloud-Security exam question is quite favourable for you to buy.

WGU Managing Cloud Security (JY02) Sample Questions (Q169-Q174):

NEW QUESTION # 169

Which concept focuses on operating highly available workloads in the cloud?

- A. Security
- B. Operational excellence
- **C. Reliability**
- D. Resource hierarchy

Answer: C

Explanation:

Reliability in cloud design ensures workloads can recover quickly from disruptions and continue operating as expected. This concept focuses on high availability, fault tolerance, and disaster recovery. Reliability requires implementing redundancy, backup strategies, and robust monitoring.

Security ensures data protection, operational excellence covers continuous improvement, and resource hierarchy refers to organizational structures, but none focus specifically on availability and resilience.

By prioritizing reliability, organizations design cloud architectures capable of withstanding failures at multiple layers—compute, storage, networking, and even regions. This design principle ensures customer trust and compliance with service-level agreements.

NEW QUESTION # 170

Which technique is used to count source and destination internet protocol (IP) addresses in incoming log flow across all log sources?

- A. Software error
- **B. Frequency**
- C. Baseline
- D. Time

Answer: B

Explanation:

Frequency analysis is the technique used to count source and destination IP addresses in incoming log flows across multiple log sources. Managing Cloud principles explain that frequency-based analysis evaluates how often specific events, IP addresses, or actions occur within collected log data.

By counting the number of times an IP address appears as a source or destination, security teams can identify anomalies such as distributed scanning, brute-force attacks, or denial-of-service activity. Frequency analysis is commonly used within SIEM platforms to correlate logs from firewalls, servers, applications, and network devices.

The other options do not perform this function. Software error refers to application faults, time-based analysis focuses on event duration or timestamps, and baseline establishes normal behavior patterns rather than counting occurrences. Therefore, frequency is the correct technique.

NEW QUESTION # 171

A breach caused by lack of security management resulted in a civil lawsuit. The organization must communicate with the entity that is responsible for performing adequate oversight. Who should be contacted?

- A. IT department
- B. High-level government agencies
- C. Cloud customer
- **D. Board of director members**

Answer: D

Explanation:

In the event of a civil lawsuit resulting from inadequate security management, the organization must communicate with the board of directors. Managing Cloud guidance explains that the board of directors holds ultimate responsibility for governance, oversight, and risk management within an organization.

The board ensures that appropriate policies, controls, and management structures are in place to protect organizational assets and comply with legal obligations. In legal matters, the board must be informed to oversee response strategies, legal counsel engagement, and corrective actions.

The IT department manages technical controls but does not provide organizational oversight. High-level government agencies are regulators, not internal oversight bodies. Therefore, board members are the correct entity to contact.

NEW QUESTION # 172

Which U.S. standard is used by federal government agencies to manage enterprise risk?

- A. The Statement on Standards for Attestation Engagements 18 (SSAE 18)
- B. International Organization for Standardization (ISO) 37500
- **C. The National Institute of Standards and Technology (NIST) SP 800-37**
- D. The Committee of Sponsoring Organizations (COSO) framework

Answer: C

Explanation:

Federal agencies in the U.S. rely on NIST SP 800-37, Risk Management Framework (RMF), to manage enterprise risk. RMF provides a structured process for categorizing systems, selecting controls, implementing safeguards, assessing effectiveness, authorizing operations, and continuous monitoring.

ISO 37500 deals with outsourcing governance, SSAE 18 governs service provider audits, and COSO is a corporate governance framework but not specific to federal agencies.

NIST RMF is integrated with the Federal Information Security Modernization Act (FISMA) requirements, ensuring agencies manage cybersecurity risks consistently. Its adoption is expanding beyond government into industries seeking comprehensive, repeatable risk management processes.

NEW QUESTION # 173

Which risk may be faced by users when using software resources in the platform as a service (PaaS) cloud model?

- A. Web application security
- B. Guest escape
- C. Software interoperability
- **D. Information bleed**

Answer: D

Explanation:

Information bleed is a risk associated with the Platform as a Service (PaaS) cloud model. Managing Cloud principles explain that PaaS environments are inherently multi-tenant, with multiple customers sharing the same underlying platform components such as runtimes, databases, and middleware.

If isolation controls are weak or misconfigured, data from one tenant may inadvertently become accessible to another. This unintended exposure is referred to as information bleed and represents a significant confidentiality risk in shared environments.

Guest escape is primarily related to virtualization at the infrastructure layer, software interoperability is a functional concern, and web application security applies across all service models. Therefore, information bleed is the most relevant PaaS-specific risk.
