NEW QUESTION # 187

CCM: A company wants to use the IaaS offering of some CSP. Which of the following options for using CCM is NOT suitable for the company as a cloud customer?

- A. Use CCM to build a detailed list of requirements and controls that they want their CSP to implement
- **B. None of the above**
- C. Submit the CCM on behalf of the CSP to CSA Security, Trust & Assurance Registry (STAR), a free, publicly accessible registry that documents the security controls provided by CSPs
- D. Use CCM to help assess the risk associated with the CSP

Answer: B

NEW QUESTION # 188

Use elastic servers when possible and move workloads to new instances.

- **A. True**
- B. False

Answer: A

NEW QUESTION # 189

In the context of cloud security, which approach prioritizes incoming data logs for threat detection by applying multiple sequential filters?

- A. Unfiltered bulk analysis
- **B. Cascade-and-filter approach**
- C. Parallel processing approach
- D. Streamlined single-filter method

Answer: B

Explanation:

The Cascade-and-filter approach is a method used in cloud security to handle incoming data logs efficiently. It prioritizes logs for threat detection by applying multiple sequential filters, where each filter progressively narrows down the data. This approach helps in:

- * Layered threat detection: Early filters eliminate non-critical data, while subsequent filters perform more detailed analysis.
- * Efficient processing: Reduces the volume of data passed through advanced and resource-intensive filters.
- * Improved accuracy: Allows focusing on the most relevant security events.

For example, in a cloud environment, the first filter might check for known malicious IP addresses, the second might look for suspicious file types, and subsequent filters may perform behavioral analysis or anomaly detection.

Why Other Options Are Incorrect:

- * B. Parallel processing approach: This method processes logs simultaneously, not sequentially, and is less efficient for prioritizing

threats.

* C. Streamlined single-filter method: Uses a single filter for all data, which lacks depth and thoroughness in identifying complex threats.

* D. Unfiltered bulk analysis: This approach is resource-intensive and inefficient, as it does not prioritize or filter logs.
