### CompTIA Security+ Certification Exam Sample Questions (Q1163-Q1168):

#### NEW QUESTION # 1163

A company is required to use certified hardware when building networks. Which of the following best addresses the risks associated with procuring counterfeit hardware?

- A. A right to audit clause in vendor contracts and SOWs
- **B. A thorough analysis of the supply chain**
- C. An in-depth penetration test of all suppliers and vendors
- D. A legally enforceable corporate acquisition policy

**Answer: B**

Explanation:

Explanation

Counterfeit hardware is hardware that is built or modified without the authorization of the original equipment manufacturer (OEM). It can pose serious risks to network quality, performance, safety, and reliability<sup>12</sup>. Counterfeit hardware can also contain malicious components that can compromise the security of the network and the data that flows through it<sup>3</sup>. To address the risks associated with procuring counterfeit hardware, a company should conduct a thorough analysis of the supply chain, which is the network of entities involved in the production, distribution, and delivery of the hardware. By analyzing the supply chain, the company can verify the origin, authenticity, and integrity of the hardware, and identify any potential sources of counterfeit or tampered products. A thorough analysis of the supply chain can include the following steps:

Establishing a trusted relationship with the OEM and authorized resellers  
 Requesting documentation and certification of the hardware from the OEM or authorized resellers  
 Inspecting the hardware for any signs of tampering, such as mismatched labels, serial numbers, or components  
 Testing the hardware for functionality, performance, and security  
 Implementing a tracking system to monitor the

hardware throughout its lifecycle Reporting any suspicious or counterfeit hardware to the OEM and law enforcement agencies

#### NEW QUESTION # 1164

A user downloaded software from an online forum. After the user installed the software, the security team observed external network traffic connecting to the user's computer on an uncommon port. Which of the following is the most likely explanation of this unauthorized connection?

- A. The user's computer had a fileless virus.
- B. The software had a hidden keylogger.
- C. The software was ransomware.
- **D. The software contained a backdoor.**

**Answer: D**

Explanation:

The software contained a backdoor bypassing normal authentication method.

#### NEW QUESTION # 1165

A client demands at least 99.99% uptime from a service provider's hosted security services. Which of the following documents includes the information the service provider should return to the client?

- **A. SLA**
- B. SOW
- C. MOU
- D. MOA

**Answer: A**

Explanation:

A service level agreement (SLA) is a document that defines the level of service expected by a customer from a service provider, indicating the metrics by which that service is measured, and the remedies or penalties, if any, should the agreed-upon levels not be achieved. An SLA can specify the minimum uptime or availability of a service, such as 99.99%, and the consequences for failing to meet that standard. A memorandum of agreement (MOA), a statement of work (SOW), and a memorandum of understanding (MOU) are other types of documents that can be used to establish a relationship between parties, but they do not typically include the details of service levels and performance metrics that an SLA does. #### NEW QUESTION # 1166

A company is developing a business continuity strategy and needs to determine how many staff members would be required to sustain the business in the case of a disruption. Which of the following best describes this step?

- A. Tablet exercise
- B. Geographic dispersion
- C. Redundancy
- **D. Capacity planning**

**Answer: D**

Explanation:

Capacity planning is the process of determining the resources needed to meet the current and future demands of an organization. Capacity planning can help a company develop a business continuity strategy by estimating how many staff members would be required to sustain the business in the case of a disruption, such as a natural disaster, a cyberattack, or a pandemic. Capacity planning can also help a company optimize the use of its resources, reduce costs, and improve performance. ### NEW QUESTION # 1167

A systems administrator works for a local hospital and needs to ensure patient data is protected and secure. Which of the following data classifications should be used to secure patient data?

- A. Sensitive
- B. Critical
- C. Private
- D. Public

**Answer: A**

Explanation:

Explanation

Data classification is a process of categorizing data based on its level of sensitivity, value, and impact to the organization if compromised. Data classification helps to determine the appropriate security controls and policies to protect the data from unauthorized access, disclosure, or modification. Different organizations may use different data classification schemes, but a common one is the four-tier model, which consists of the following categories: public, private, sensitive, and critical.

Public data is data that is intended for public access and disclosure, and has no impact to the organization if compromised. Examples of public data include marketing materials, press releases, and public web pages.

Private data is data that is intended for internal use only, and has a low to moderate impact to the organization if compromised.

Examples of private data include employee records, financial reports, and internal policies.

Sensitive data is data that is intended for authorized use only, and has a high impact to the organization if compromised. Examples of sensitive data include personal information, health records, and intellectual property.

Critical data is data that is essential for the organization's operations and survival, and has a severe impact to the organization if compromised. Examples of critical data include encryption keys, disaster recovery plans, and system backups.

Patient data is a type of sensitive data, as it contains personal and health information that is protected by law and ethical standards.

Patient data should be used only by authorized personnel for legitimate purposes, and should be secured from unauthorized access, disclosure, or modification. Therefore, the systems administrator should use the sensitive data classification to secure patient data.
