Salesforce Certified Platform Developer II (PDII) Sample Questions (Q101-Q106):

NEW QUESTION # 101

A developer is asked to develop a new AppExchange application. A feature of the program creates Survey records when a Case reaches a certain stage and is of a certain Record Type. This feature needs to be configurable, as different Salesforce instances require Surveys at different times. Additionally, the out-of-the-box AppExchange app needs to come with a set of best practice settings that apply to most customers. What should the developer use to store and package the custom configuration settings for the app?

- A. Process Builder
- B. Custom Settings
- C. Custom Metadata
- D. Custom Objects

Answer: C

NEW QUESTION # 102

A custom field `Exec_Count_c` of type Number is created on an Account object. An account record with value of "1" for `Exec_Count_c` is saved. A workflow field update is defined on the `Exec_Count_c` field, to increment its value every time an account record is created or updated. The following trigger is defined on the account: `trigger ExecOrderTrigger on Account (before insert, before update, after insert, after update) { for (Account accountInstance: Trigger.New) { if (Trigger.isBefore) { accountInstance.Exec_Count_c += 1; System.debug(accountInstance.Exec_Count_c); } } }` What is printed from the `System.debug` statement? Output from `System.debug` in every iteration is separated with a delimiter.

- A. 2,2,3,3
- B. 2,2,4,4
- C. 1,2,3,4
- D. 1,2,3,3

Answer: B

NEW QUESTION # 103

What is the most efficient way in Visualforce to show information based on data filters defined by an end-user for a large volume of data?

- A. Use filter conditions in a SOQL query to limit data based on data filters.
- B. Use an Apex controller to refine raw data based on data filters and store the result in a static variable.

Salesforce Platform Developer II Sample Questions (Q159-Q164):

NEW QUESTION # 159

A company processes Orders within their Salesforce instance. When an Order's status changes to 'Paid' it must notify the company's order management system (OMS). The OMS exposes SOAP web service endpoints to listen for when to retrieve the data from Salesforce. What is the optimal method to implement this?

- A. Generate the Enterprise WSDL and use it to make a callout to the OMS.
- B. Create an Apex trigger and make a callout to the OMS from the trigger.
- C. Generate the Partner WSDL and use it to make a callout to the OMS.
- D. Create an Outbound Message that contains the session ID and send it to the OMS.

Answer: A

NEW QUESTION # 160

In an organization that has multi-currency enabled, a developer is tasked with building a Lightning component that displays the top ten Opportunities most recently accessed by the logged in user. The developer must ensure the Amount and LastModifiedDate field values are displayed according to the user's locale.

What is the most effective approach to ensure values displayed respect the user's locale settings?

- A. Use the `FORMAT ()` function in the SOQL query.
- B. Use a wrapper class to format the values retrieved via SOQL.
- C. Use REGEX expressions to format the values retrieved via SOQL.
- D. Use the FOR VIEW clause in the SOQL query.

Answer: A

Explanation:

To ensure the values displayed respect the user's locale settings, the most effective approach is to use the `FORMAT()` function in the SOQL query. The `FORMAT()` function converts the field values in the query result to the user's locale, if the field is a date, date/time, currency, number, or percent field. The `FORMAT()` function also respects the multi-currency settings, and converts the currency values to the user's currency. The developer can use the `FORMAT()` function for the Amount and LastModifiedDate fields in the SOQL query, and display the formatted values in the Lightning component. Using REGEX expressions to format the values retrieved via SOQL would not be effective, as it would require complex and error-prone string manipulation, and it would not respect the multi-currency settings. Using a wrapper class to format the values retrieved via SOQL would not be effective, as it would require additional Apex code and memory allocation, and it would not respect the multi-currency settings. Using the FOR VIEW clause in the SOQL query would not be effective, as it would only mark the records as viewed, but it would not format the field values according to the user's locale. NEW QUESTION # 161

Developer wishes to improve runtime performance of Apex calls by caching results on the client. What is the best way to implement this?

- A. Call the `setStorable()` method on the action in the JavaScript client-side code.
- B. Set a cookie in the browser for use upon return to the page.
- C. Decorate the server-side method with `@AuraEnabled(cacheable=true)`.
- D. Decorate the server-side method with `@AuraEnabled(storable=true)`.

Answer: A

NEW QUESTION # 162

What can the Apex Continuation class be used for?

- A. Progressing records to the next stage of an approval process in Apex.
- **B. Making asynchronous callouts to SOAP or REST Web Services from Visualforce.**
- C. Chaining multiple Queueable Apex jobs to be processed one after another.
- D. Maintaining an Apex transaction across multiple DML statements.

Answer: B

NEW QUESTION # 163

A developer needs to add code to a Lightning web component's configuration file so the component only renders for a desktop size form factor when on a record page. What should the developer add to the component's record page target configuration to meet this requirement?

- A. `<design> ...`
- **B. `<supportedFormFactors> <supportedFormFactor type="Large"/> </supportedFormFactors>`**
- C. `<property name="formFactor" value="Large"> ...`
- D. `<lightningLayout> </lightningLayout>`

Answer: B

Explanation:

In a Lightning Web Component's configuration file (.js-meta.xml), the `<supportedFormFactors>` tag allows the developer to specify which device form factors the component supports. To restrict the component to only render on desktop devices, the developer must specify the `type="Large"`.

The structure is:

XML

```
<targetConfigs>
<targetConfig targets="lightning__RecordPage">
<supportedFormFactors>
<supportedFormFactor type="Large"/>
</supportedFormFactors>
</targetConfig>
</targetConfigs>
```

If `supportedFormFactors` is not specified, the component defaults to supporting both Small (phone) and Large (desktop) form factors. Options B, C, and D are incorrect syntax for defining form factor support in LWC metadata.
