### NEW QUESTION # 154

How is a Search Workflow Action configured to run at the same time range as the original search?

- A. Select the same time range from the time-range picker.
- B. Select the "Overwrite time range with the original search" checkbox.
- C. Set the earliest time to match the original search.
- D. Select the "Use the same time range as the search that created the field listing" checkbox.

**Answer: D**

Explanation:

To configure a Search Workflow Action to run at the same time range as the original search, you need to select the "Use the same time range as the search that created the field listing" checkbox. This will ensure that the workflow action search uses the same earliest and latest time parameters as the original search.

### NEW QUESTION # 155

To which of the following can a field alias be applied?

- A. A given host, source, or sourcetype.
- B. Data found in a lookup table.
- C. Only one single field in a dataset.
- D. Either a calculated field or an extracted field.

**Answer: D**

Explanation:

In Splunk, a field alias is used to create an alternative name for an existing field, making it easier to refer to data in a consistent manner across different searches and reports. Field aliases can be applied to both calculated fields and extracted fields. Calculated fields are those that are created using eval expressions, while extracted fields are typically those parsed from the raw data at index time or search time. This flexibility allows users to streamline their searches by using more intuitive field names without altering the underlying data. Field aliases cannot be applied to data in a lookup table, specific individual fields within a dataset, or directly to a host, source, or sourcetype.

### NEW QUESTION # 156

Which of the following statements about data models and pivot are true? (Choose all that apply.)

- A. Pivot requires users to input SPL searches on data models.
- B. Data models are created out of datasets called pivots.
- C. Pivot allows the creation of data visualizations that present different aspects of a data model.
- D. They are both knowledge objects.

**Answer: B,C**

### NEW QUESTION # 157

What happens to the original field name when a field alias is created?

- A. The original field name is not affected by the creation of a field alias.
- B. The original field name still exists in the index but is not visible to the user at search time.
- C. The original field name is replaced by the field alias within the index.
- D. The original field name is italicized to indicate that it is not an alias.

**Answer: A**

Explanation:

Creating a field alias in Splunk does not modify or remove the original field. Instead, the alias allows the same data to be accessed using a different field name without affecting the original field.
