NEW QUESTION # 13

Match each OSD (Object Storage Device) feature with its description:

OSD Features	Description
Flexible data access method	Drives data placement and protection based on the service requirements
Metadata-driven policy	Abstracts storage from the application and provides a common view independent of location
Data protection	Supports REST/SOAP APIs and the file sharing protocols, CIFS and NFS, for file services
Global namespace	Global distribution of objects using either replication or erasure coding

Answer:

#Flexible data access method: Object storage can offer multiple ways to access and interact with stored data, such as REST/SOAP APIs (for object-based access) and file-sharing protocols (CIFS, NFS) for file-level access.

#Metadata-driven policy: Object storage uses rich metadata to define how objects are placed, protected, and managed, driven by policies that respond to service-level requirements.

#Data protection: Object storage systems implement data protection at a global scale through replication or erasure coding to ensure data durability and availability.

#Global namespace: Object storage abstracts physical locations, providing a single namespace (a unified view) so that applications can seamlessly access data regardless of where it physically resides.

NEW QUESTION # 14

Question:

What is the maximum number of VLANs that can be supported with one VLAN tag field?

- A. 0
- B. 1
- C. 2
- D. 3

Answer: D

Explanation:

In Ethernet networking, VLANs (Virtual Local Area Networks) are identified using a 12-bit VLAN ID field in the IEEE 802.1Q standard. Since 12 bits can represent $2^{12} = 4096$ unique values, the maximum number of VLANs that can be supported is 4096.

* 1024 and 2048: These values are less than the maximum and represent subsets of possible VLANs.

* 8192: This exceeds the 12-bit limit and is not supported by the standard.

NEW QUESTION # 15

Question:

Which operations management process is responsible for maintaining information about configuration items (CIs)?

- A. Capacity management
- B. Change management
- C. Performance management
- **D. Configuration management**

Answer: D

Explanation:

Configuration Management is the process that ensures all configuration items (CIs) are identified, tracked, and maintained throughout their lifecycle. It maintains a Configuration Management Database (CMDB) that records the relationships and configurations of various components in the IT environment.

NEW QUESTION # 16

Question:

An IT department needs to execute automated tasks to perform a business operation. They require workflows for arranging, coordinating, and managing these tasks. Which layer of the Modern Data Center Architecture provides this functionality?

- **A. Orchestration**
- B. Physical infrastructure
- C. Services
- D. Virtual infrastructure

Answer: A

Explanation:

The orchestration layer in a modern data center architecture is responsible for automating and coordinating complex tasks and workflows. It enables the integration and management of various services and resources to perform business operations efficiently.

* Physical infrastructure:Comprises the hardware components.

* Virtual infrastructure:Includes virtualized resources like VMs.

* Services:Deliver specific functionalities to end-users.

NEW QUESTION # 17

Question:

(Refer to exhibit diagram)

The diagram shows a SAN zoning configuration with three zones: Zone 1 (Mixed), Zone 2 (WWN), and Zone 3 (Port). Which zoning type is used in Zone 2?

- **A. WWN zoning**
- B. No zoning
- C. Mixed zoning
- D. Port zoning

Answer: A

Explanation:

WWN zoning uses the World Wide Names (unique identifiers) of devices (HBAs and targets) to define zone membership. Offers flexibility: devices can be moved to different ports without reconfiguring zoning.

Common in modern SAN environments.

* Port zoning uses physical port numbers for zone membership.

* Mixed zoning combines port and WWN methods.

* No zoning would not segment traffic.
