UiPath Certified Professional Agentic Automation Associate (UiAAA) Sample Questions (Q38-Q43):

NEW QUESTION # 38

You are part of a Procurement team that often struggles with manually reviewing and comparing quotations from different vendors. This process is time-consuming, prone to human errors, and lacks real-time price validation. Keeping up with internal rules and market standards makes things even more difficult. This can cause problems and cost overruns. How agents can help?

- A. Agents rely on preloaded prices set by vendors and do not research market rates, verify compliance, or provide detailed validation, leading to potential errors and inefficiencies during quotation reviews.
- B. Agents automate price validation by extracting item details from quotations, use tools to research market prices, checking policy compliance, and cross-verifying prices against benchmarks before sharing results with procurement officers for better

decision-making

- C. Agents focus on sending reminders for deadlines but do not automate price analysis, extract item details, or validate compliance with internal rules, slowing down decision-making for procurement officers.
- D. Agents only store vendor quotations without cross-verifying prices, researching market trends, or checking compliance with policies, leaving procurement officers to manually manage the entire validation process.

Answer: B

Explanation:

C is correct - agents in UiPath can intelligently automate complex procurement workflows by combining tools like document extraction, web search for price benchmarks, policy validation, and LLM-based reasoning.

In this use case:

- * The agent extracts structured data (item, price, quantity) from multiple quotations
- * Compares prices with external market sources using Web Search or integrated APIs
- * Applies company policies or thresholds using system prompts and guardrails
- * Flags anomalies, escalates exceptions, or provides summarized comparisons This reduces:
 - * Manual effort
 - * Human error
 - * Turnaround time for approvals

And increases:

- * Policy compliance
- * Market alignment
- * Decision speed for procurement officers

Options A, B, and D all fall short of UiPath agent capabilities. These responses describe passive or limited automations, whereas agents are built to operate proactively and contextually, especially in high-value business functions like procurement.

This example reflects the agentic automation blueprint at work - combining perception, decision, and action across multiple systems in real time.

NEW QUESTION # 39

You are building an agent that classifies incoming emails into one of three categories: Urgent, Normal, or Spam. You want to improve accuracy by using few-shot examples in a structured format. Which approach best supports this goal?

- A. Show one example and leave the label blank for inference.
- B. Use unlabeled prompts followed by ranked categories:
Classify this. "Need update on report." - [1] Urgent [2] Normal [3] Spam
- C. Include three random emails and let the LLM guess the intent.
- **D. Use examples such as:**
Input: "Please address this issue immediately, server is down!" Output: "Urgent"

Answer: D

Explanation:

Comprehensive and Detailed Explanation (from UiPath Agentic Automation documentation):

The correct approach is C, as it best reflects the few-shot prompting pattern, which is a well-documented and recommended technique in both UiPath Autopilot™ and broader agentic AI design for improving intent classification accuracy.

In UiPath Agentic Automation, especially in Prompt Engineering, few-shot examples serve to "ground" the Large Language Model (LLM) with task-specific context. Providing structured input-output pairs (as shown in option C) allows the model to learn from the context and mirror the expected output more reliably - enhancing classification precision.

For instance, UiPath recommends using clearly formatted training examples in this structure:

Input: "[Text]"

Output: "[Label]"

This aligns with UiPath's guidance under the Prompt Engineering Framework, which highlights that using few-shot exemplars with clear task demonstrations significantly improves model performance over zero-shot or ambiguous input formats (as in options A or B). Option D also underperforms due to insufficient grounding.

UiPath emphasizes the importance of label clarity, format consistency, and explicit instruction - all of which are satisfied in Option C. This method also supports prompt generalization for new inputs by modeling how categorization should happen, not just what categories exist.

This technique is crucial in real-world agentic workflows where LLMs handle noisy, unstructured data (like emails), and are expected to trigger appropriate downstream actions such as ticket creation, escalation, or filtering.

NEW QUESTION # 40

Which configuration area defines what the agent should do after a human resolves the escalation?

- A. Outcome behavior section
- B. Inputs description fields
- C. Agent Memory toggle
- D. Assignment recipient list

Answer: A

Explanation:

The correct answer is D- the Outcome Behavior section is where you configure how the agent should respond once an escalation is resolved by a human.

In UiPath's agent design process, when a task is escalated to a human reviewer (via Action Center, for instance), the agent:

- * Waits for human input
- * Receives an Outcome (e.g., Approve, Reject, Flag)
- * Then continues its process based on logic defined in the Outcome Behavior. This may include:
 - * Proceeding with the automation
 - * Triggering an alternate flow
 - * Logging results or escalating further

Other options are incorrect or refer to unrelated settings:

- * A (Assignment recipient list) defines who gets the task - not what happens after.
- * B (Agent Memory toggle) governs context retention, not post-escalation behavior.
- * C (Input descriptions) help users understand fields but don't control flow logic.

The Outcome Behavior section ensures agents respond intelligently and consistently after human interaction, which is critical in hybrid workflows involving both automation and human-in-the-loop review.

NEW QUESTION # 41

What is one of the key benefits of providing RAG as a service to UiPath generative AI experiences?

- A. It reduces the risk of hallucination by referencing ground truth data stores.
- B. It eliminates the need for knowledge bases by integrating all proprietary data directly into generative applications.
- C. It exclusively provides access to historical data sources without supporting real-time updates.
- D. It directly increases the LLM context window size without any interaction with knowledge bases.

Answer: A

Explanation:

The correct answer is A - RAG (Retrieval-Augmented Generation) enhances generative AI experiences in UiPath by providing grounded, context-relevant data at runtime, which significantly reduces hallucinations.

Here's how it works:

When an LLM receives a query, RAG pulls relevant documents or snippets from enterprise data sources (like knowledge bases, SharePoint, Confluence).

This content is passed to the LLM as context, enabling the model to respond using ground truth, not generic or fabricated knowledge.

UiPath's GenAI platform and agentic agents use RAG to:

Enrich prompt context

Drive document-based answers

Support fact-checked decisions in customer service, HR, IT, etc.

Option B is false - RAG doesn't alter the LLM's context window.

C is incorrect - RAG works because it queries live knowledge bases.

D is wrong - RAG supports real-time dynamic data, not just historical.

NEW QUESTION # 42

Which of the following best describes a challenge faced by traditional automation in complex business processes?

- A. Excessive flexibility in handling varied workflows across different systems like CRM and ERP

- B. Limited ability to automate unstructured tasks that require judgment and contextual awareness
- C. Over-reliance on AI-powered agents for all types of automation tasks
- D. Inability to perform repetitive, structured tasks efficiently and reliably

Answer: B

Explanation:

The correct answer is C, which highlights one of the core limitations of traditional rule-based automation (RPA) - its inability to handle unstructured tasks that require human-like reasoning and contextual awareness.

According to UiPath's Agentic Automation documentation, traditional automation excels at repetitive, rules-based, structured tasks. However, it struggles when:

- * Input data is unstructured (like emails, PDFs, or chat logs)
- * Tasks require contextual understanding, decision-making, or judgment
- * Processes span across systems with unpredictable flows (e.g., CRM + ERP + email) This is exactly where Agentic Automation steps in. It augments classic automation by embedding LLMs, AI agents, and decision intelligence to manage tasks involving ambiguity, variability, and natural language - things traditional bots cannot handle well.

Options A, B, and D are incorrect or misleading:

- * A is false because traditional automation is not flexible across varied workflows.
- * B is the opposite of traditional automation - it's agentic.
- * D is inaccurate because RPA handles repetitive, structured tasks very well - that's its strength.

By addressing C, UiPath bridges the gap between deterministic automation and intelligent, adaptive systems that can truly scale across complex, real-world business scenarios.
