問題 #13

Question:

What is a read miss in cache operations?

- A. Writing data to the cache
- B. Fetching data that is not in cache
- C. Deleting data from the cache
- D. Fetching requested data that is already in cache

答案： B

解題說明：

A read miss occurs when the data requested by the host is not available in the cache. As a result, the storage system must fetch the data from the slower disk storage (back-end), leading to higher latency.

* Cache hit: Data is already in cache # faster response.

* Cache miss (read miss): Data not in cache # fetched from the disk.

問題 #14

Question:

What method does FCIP use to transport Fibre Channel SAN data?

- A. FCIP splits LAN and FC SAN data and tunnels FC SAN data over Ethernet networks.
- **B. FCIP encapsulates and tunnels FC SAN data over IP networks.**
- C. FCIP encapsulates and tunnels FC SAN data over Ethernet networks.
- D. FCIP separates LAN and FC SAN data and tunnels FC SAN data over IP networks.

答案： B

解題說明：

FCIP (Fibre Channel over IP) is a protocol used to connect Fibre Channel SANs across geographically dispersed locations over IP networks. It does this by encapsulating Fibre Channel frames into IP packets (Layer 3). This allows FC SAN traffic to be transmitted across IP-based WANs.

* Ethernet networks (Layer 2) are not involved in the FCIP encapsulation process directly because FCIP uses IP packets.

* Splitting LAN/SAN data is not the method used; FCIP encapsulates all FC frames.

* Separating LAN and SAN data also does not describe the tunneling function.

Reference: Dell Information Storage and Management Foundations 2023 Study Guide, Section: FCIP Connectivity.

問題 #15

Question:

A customer uses FCIP to connect local and remote FC SANs. The remote SAN is replicated to and used to store daily backup data. Latency over the IP WAN increases to unacceptable levels during peak replication periods. No other data transfer services using the WAN experience the same latency problem.

What is the likely cause of the data replication performance issue?

- **A. IP packet segmentation**
- B. FCIP gateway FC ports set to TE_Port mode
- C. Ethernet frame segmentation
- D. FCIP gateway FC ports set to EX_Port mode

答案： A

解題說明：

IP packet segmentation can cause replication performance issues over the WAN.

Since FCIP tunnels FC frames over IP networks, if the IP packet size exceeds the MTU, packets are fragmented and reassembled, increasing latency.

* TE_Port mode is used for trunking, not related to packet fragmentation.

* EX_Port mode is used for inter-switch connectivity (FCR).

* Ethernet frame segmentation is not relevant in FCIP tunneling.

問題 #16

Question:

What is true about the FCIP?

- A. Connects local iSCSI SANs to remote FC SANs

- B. Connects local FC or iSCSI SANs to remote FC or iSCSI SANs
- C. Connects local iSCSI SANs to remote iSCSI SANs
- **D. Connects local FC SANs to remote FC SANs**

答案：D

解題說明：

FCIP (Fibre Channel over IP) is used to tunnel Fibre Channel traffic over IP networks. Its primary use case:

- * Connecting local FC SANs to remote FC SANs for disaster recovery and remote data replication.
- * It encapsulates FC frames into IP packets, transporting them over existing IP infrastructure.
- * Option B/C/D iSCSI is not directly involved in FCIP's primary function.

問題 #17

Question:

What is a key benefit for deploying a remote data protection and recovery solution in a data center environment?

- A. Avoids security risks that expose business data
- B. Reduces the cost of protecting data
- **C. Maximizes application and information availability**
- D. Reduces required maintenance time for IT resources

答案：C

解題說明：

Remote data protection and recovery solutions, like replication and cloud-based backup, are primarily designed to ensure maximum application and information availability. They protect data in the event of:

- * Local failures (disk, server, or site outages)
- * Natural disasters (floods, fires)
- * Ransomware attacks

By having off-site copies and failover options, businesses maintain continuous access to critical data.
