ISTQB-CTAL-TA教育資料、ISTQB-CTAL-TA関連復習問題集

当社は長年にわたり、クライアントに最高のISTQB-CTAL-TA練習問題を提供し、テストISTQB-CTAL-TA認定試験にスムーズに合格できるように常に努めています。当社は、国内の有名な業界の専門家を募集し、優秀な人材をISTQB-CTAL-TA学習ガイドを編集し、お客様に心から奉仕するために最善を尽くしました。当社は、お客様が私たちの神であり、ISTQB-CTAL-TAトレーニング資料の品質に関する厳格な基準であるというサービス理念を設定しています。

ISTQB (ISTQB CTAL-TA) ISTQB Certified Tester Advanced Level - Test Analyst (Syllabus 2012) 認定 ISTQB-CTAL-TA 試験問題 (Q23-Q28):

質問 # 23

A web-based system is being developed to support the administration of tennis tournaments.

The system provides advice on how much money to offer each player as their individual attendance fee.

The amount depends on a combination of the following factors:

- * Overall attendance fund (divided into five numeric ranges)
- * Player's current world ranking (divided into ten numeric ranges)
- * Whether it is a local tournament for the player (YES or NO)
- * Their relationship with the tournament sponsors (clothing, equipment, or endorsement)
- * Their previous attendance history at this event (finalist, played, withdrew before event, or withdrew during event) It has been noted

that the attendance fee calculation does not take account of 'last minute' invitations that are made to replace a player who withdraws close to the tournament start date. In this case, enhanced attendance fees are offered depending on whether the invitation is made within a week, a fortnight, or a month of the tournament start date.

Which of the following specification-based techniques would be the BEST choice for testing the 'last minute' scenario where players are replaced close to the tournament start, and what type of defect is being targeted by the testing?

SELECT ONE OPTION:

- A. Equivalence Partitioning technique; Date formatting defects
- B. Use Case testing technique; Fee specification defects
- C. Boundary Value Analysis technique; Date comparison defects
- **D. Decision Table testing technique; Fee calculation defects**

正解: D

解説:

Comprehensive and Detailed In-Depth Explanation:

* A (Decision Table testing technique): Correct. Decision tables are ideal for handling complex combinations and business rules, such as calculating fees based on various factors. The defect here is related to fee calculation logic.

* B (Use Case testing): Incorrect. Use cases are better for user interaction scenarios.

* C (Equivalence Partitioning): Incorrect. Date formatting is not the issue here.

* D (Boundary Value Analysis): Incorrect. The problem is not with date comparison, but with rule-based fee calculation. Therefore, the correct answer is A (Decision Table testing technique; Fee calculation defects).

質問 # 24

Consider the following user story: As a student, I want to be able to buy a parking pass (priority: high) Acceptance criteria

- The student will not receive the parking pass if the payment is insufficient.
- Only registered students can buy a parking pass.
- The student can only buy one parking pass each month.

Which of the following checklist items would result in finding a defect for the user story?

- A. Does the story follow the commonly used format "As a <>, I want <> so that <>?"
- **B. Are the acceptance criteria defined and testable?**
- C. Is the story written from the view of the person who requested it?
- D. Is the story prioritized?

正解: B

解説:

The checklist item that would result in finding a defect for the user story is "Are the acceptance criteria defined and testable?". The acceptance criteria are the conditions that a system or component must satisfy in order to be accepted by a user, customer, or other authorized entity. The acceptance criteria should be defined and testable for each user story, as they provide the basis for designing and executing test cases. The user story in this question does not have any acceptance criteria defined, which is a defect that needs to be addressed. 質問 # 25

To enhance both the effectiveness and efficiency of the test design phase, the purchase of a test design tool is being considered.

Which one of these statements best characterizes a test design tool?

- A. A test design tool validates models of the software.
- B. A test design tool enables individual tests to be traced to requirements
- **C. A test design tool generates test inputs from requirements**
- D. A test design tool enables tests to be executed automatically.

正解: C

解説:

The statement that best characterizes a test design tool is that a test design tool generates test inputs from requirements. A test design tool is a tool that supports the test design activity by generating test inputs or test cases from a specified source, such as

requirements, models, or code. A test design tool can use various techniques, such as equivalence partitioning, boundary value analysis, decision tables, state transition diagrams, etc., to generate test inputs or test cases. Verified References: [ISTQB Certified Tester Advanced Level Test Analyst CTAL-TA], Section 6.2.1, page 77.

質問 # 26

A web-based system is being developed to support the administration of tennis tournaments.

The system provides advice on how much money to offer each player as their individual attendance fee. The amount depends on a combination of the following factors:

- * Overall attendance fund (divided into five numeric ranges)
 - * Player's current world ranking (divided into ten numeric ranges)
 - * Whether it is a local tournament for the player (YES or NO)
 - * Their relationship with the tournament sponsors (clothing, equipment, or endorsement)
 - * Their previous attendance history at this event (finalist, played, withdrew before event, or withdrew during event)
- The new system needs to be ready for the next tournament in just a few months' time, so testing schedules will be severely challenged.

Which specification-based technique would be the BEST choice in the circumstances?

SELECT ONE OPTION:

- A. Pairwise testing
- B. Equivalence partitioning
- C. Use case testing
- D. State Transition testing

正解: A

解説:

Comprehensive and Detailed In-Depth Explanation:

- * A (Use case testing): Not suitable as it focuses on user interactions rather than combinations of input values.
 - * B (State Transition testing): Irrelevant since the focus is not on state changes.
 - * C (Equivalence partitioning): Good for partitioning input values but not efficient for combinations.
 - * D (Pairwise testing): Correct. This technique is highly efficient for covering combinations of multiple variables with fewer test cases, which is crucial when the schedule is tight.
- Therefore, the correct answer is D (Pairwise testing).

質問 # 27

You are testing a hospital patient management system. New or amended patient data is captured by hospital administrators using an in-house patient capture application and transmitted to one or more hospital departments depending on the nature of the medical condition. Each department operates its own software package.

There has been a change to the patient capture application, and you are going to run a series of interoperability tests.

Which TWO of the following are NOT interoperability defects?

- a) The patient name field is truncated on one of the receiving department systems
b) Hospital administrators find the new patient-capture application screens difficult to navigate
c) Two department systems are unable to recognize the format of international telephone numbers for foreign patients
d) Existing patient data takes too long to retrieve by the patient-capture application
e) There are spelling errors in the field names on some screens
- SELECT ONE OPTION:

- A. a, c
- B. a, b
- C. b, d

正解: C

解説:

Comprehensive and Detailed In-Depth Explanation:

- * a) Truncated data is an interoperability issue related to data exchange between systems.
 - * b) User navigation issues are related to usability, not interoperability.
 - * c) Format mismatch between systems is an interoperability defect.
 - * d) Slow data retrieval is related to performance, not interoperability.
 - * e) Spelling errors relate to usability, not interoperability.
- Therefore, the correct answer is A (b, d).

質問 # 28
