Real 220-1101 are uploaded by Real Users which provide 220-1101 Practice Tests Solutions.

Looking at the experiences of our loyal customers, you will find with the help of our excellent 220-1101 exam questions, to achieve the desired certification is no long a unreached dream. And i believe that you will definitely be more determined to pass the 220-1101 Exam. At the same time, you will also believe that our 220-1101 learning questions can really help you. We can claim that as long as you study with our 220-1101 praparation engine for 20 to 30 hours, you will pass the exam easily.

CompTIA A+ Certification Exam: Core 1 is an essential certification for IT professionals who want to pursue a career in the technology industry. 220-1101 Exam is recognized globally and is widely used as a benchmark for entry-level IT jobs. CompTIA A+ Certification Exam: Core 1 certification is also a requirement for many advanced IT certifications and can help IT professionals advance their careers.

CompTIA A+ Certification Exam: Core 1 Sample Questions (Q470-Q475):

NEW QUESTION # 470
A systems administrator is working to ensure access to corporate laptops is limited to authorized users. The administrator has already implemented a password policy. Which of the following would be the best option to help the administrator secure the corporate resources?

- A. Encryption
- B. Trusted Platform Module
- C. Biometric scanner
- D. Laptop lock

Answer: C

Explanation:
The best option to help the administrator secure the corporate resources is B. Biometric scanner.
A biometric scanner is a device that can authenticate a user's identity based on their physical or behavioral characteristics, such as fingerprint, iris, face, voice, or signature. A biometric scanner can provide a high level of security and convenience for accessing corporate laptops, as it can prevent unauthorized users from accessing the devices and eliminate the need to remember passwords . The other options are not the best options for this scenario. A Trusted Platform Module (TPM) is a chip that can store encryption keys and other sensitive data on a laptop. A TPM can enhance the security of data and devices, but it does not limit access to authorized users by itself. A TPM can work with a password or a biometric scanner to provide multifactor authentication . A laptop lock is a device that can physically secure a laptop to a desk or other object using a cable and a lock. A laptop lock can deter theft or tampering, but it does not prevent unauthorized users from accessing the laptop if they have the password or the key. Encryption is a process that can protect data on a laptop by transforming it into an unreadable format using a key. Encryption can prevent unauthorized users from accessing or modifying the data, but it does not prevent them from accessing the laptop itself.

NEW QUESTION # 471
A user who works with sensitive data has a computer configured with hard drive encryption. The TPM is active and hosting the encrypted key. After an upgrade to the motherboard, RAM, and video card, the hard drive is not booting, and data cannot be accessed from the hard drive. Which of the following should the technician do to enable the system to boot again and get access to the stored data?

- A. Use data recovery software to find and recover the hard drive information.
- B. Access the BIOS and select to rebuild the degraded RAID array.
- C. Boot into the BIOS and enable the TPM on the new motherboard.
- D. Return the replaced motherboard back to the computer.

Answer: C

Explanation:
The technician should boot into the BIOS and enable the TPM on the new motherboard to enable the system to boot again and get access to the stored data1. Boot into the BIOS and enable the TPM on the new motherboard. After upgrading the motherboard, the TPM may need to be enabled in the BIOS in order to access the encrypted key and boot the system. Enabling the TPM on the new motherboard should allow the system to boot and provide access to the encrypted data.

NEW QUESTION # 472
A user built a new PC with parts sourced torn a popular online vendor. The system boots to the OS and basic browsing works, but whenever the user opens a 4K video or starts to play a game, the system Immediately shuts down. Which of the following is the MOST likely cause of this issue?

- A. The system does not have enough RAM tor 4K video.
- B. The SSD drives do not have enough Pagefile.
- C. The CPU heat sink was attached without adequate thermal paste.
- D. The video card was Installed in the wrong PCIe slot.

Answer: C

Explanation:
Thermal paste is a substance that fills in any gaps between a CPU and its heat sink, which is a device that dissipates heat from the CPU. Without adequate thermal paste, the CPU may overheat and cause the system to shut down automatically to prevent damage. This is especially likely when running 4K video or games, which are more demanding and generate more heat. The technician should check if the CPU heat sink was attached properly and apply enough thermal paste to ensure good contact and heat transfer.

NEW QUESTION # 473
A user's desktop PC shuts down suddenly every few hours. A technician smells burning coming from the back of the PC where it is connected to the wall socket. Which of the following should the technician do first to identify the issue?

- A. Check that the power cable is not damaged.
- B. Inspect the power supply fan for debris.
- C. Verify the power supply is outputting adequate wattage.
- D. Ensure the power supply is set to the correct voltage.

Answer: A

Explanation:
If a desktop PC shuts down suddenly and there is a burning smell coming from the area where it is connected to the wall socket, the first step should be to check that the power cable is not damaged. A damaged power cable can cause electrical shorts or overheating, leading to sudden shutdowns and a burning smell. Inspecting the power cable for fraying, cuts, or other damage can help identify if it is the source of the problem.

CompTIA A+ Core 1 (220-1101) Exam Objectives, specifically the sections on troubleshooting hardware components and power-related issues, which would include assessing external factors such as the condition of power cables.
Basic electrical safety and troubleshooting principles, emphasizing the importance of checking power connections and cables when faced with symptoms of electrical issues.

NEW QUESTION # 474
A user with a self-configured, static IP address cannot connect to the internet. The technician runs an ipconfig command and receives the following output:
Which of the following should the technician edit?

- A. Subnet mask
- B. Default gateway
- C. DHCP server
- D. IPv4 address

Answer: B

Explanation:
The correct answer is D. Default gateway.
A default gateway is the device that connects a local network to other networks, such as the internet. A default gateway is usually a router or a modem that has an IP address on the same subnet as the local network. A default gateway is necessary for a device to communicate with devices outside its local network.
In this case, the user has a self-configured, static IP address of 192.168.1.20, which belongs to the subnet
192.168.1.0/24 (with a subnet mask of 255.255.255.0). However, the default gateway is set to 192.168.0.1, which belongs to a different subnet (192.168.0.0/24). This means that the user's device cannot reach the default gateway, and therefore cannot connect to the internet.
The technician should edit the default gateway to match the correct subnet of the user's device, such as
192.168.1.1 or 192.168.1.254, depending on the configuration of the network.
