MCD-Level-1 Exam Topics | Exam MCD-Level-1 Quizzes

Just look at the text version of the introduction, you may still be unable to determine whether this product is suitable for you, or whether it is worth your purchase. We are very fond of preparing trial versions of our MCD-Level-1 study materials for you so that you can have a clearly check on not only the content of the MCD-Level-1 Exam Braindumps, but also the displays. The content of the trial version is a small part of our MCD-Level-1 practice questions, and it is easy and convenient to free download.

MuleSoft Certified Developer - Level 1 (Mule 4) Sample Questions (Q128-Q133):

NEW QUESTION # 128

A REST connect module is generated for a RAML specification, and then the rest connect module is imported in mule application in Anypoint Studio. For each method of the RAML specification, what does the REST connect module provide?

- A. A scope
- B. An event source
- C. A flow
- D. An operation

Answer: C

Explanation:

Correct answer is an operation. For each method of the RAML specification, REST connect module provide an operation.

Please refer to the below screenshot.

NEW QUESTION # 129

Refer to the exhibits.

What is written to the records.csv file when the flow executes?

- A. The JSON payload
- B. An error message
- C. Nothing
- D. The payload convert to CVS

Answer: A

Explanation:

Transform Message Add write_date is covering payload in JSON format and same JSON payload is available to file write processor. However, if the payload is a different format (for example, not CSV), you can place the transformation inside the Write operation to generate content that will be written without producing a side effect on the message in transit. This is not done in this case. By default, the connector writes whatever is in the message payload. Hence JSON payload will be written to file.

NEW QUESTION # 130

How are multiple conditions used in a Choice router to route events?

- A. To find the FIRST true condition, then distribute the event to the ONE matched route.
- B. To route the same event to the matched route of EVERY true condition
- C. None of these
- D. To find the FIRST true condition, then route the same event to the matched route and ALL FOLLOWING routes

Answer: A

Explanation:

Choice router finds the FIRST true condition, then distribute the event to the ONE matched route.

MuleSoft Doc Ref: <https://docs.mulesoft.com/mule-runtime/4.1/choice-router-concept> The Choice router dynamically routes messages through a flow according to a set of DataWeave expressions that evaluate message content. Each expression is associated with a different routing option. The effect is to add conditional processing to a flow, similar to an if/then/else code block in most programming languages.

Only one of the routes in the Choice router executes, meaning that the first expression that evaluates to true triggers that route's execution and the others are not checked. If none of the expressions are true, then the default route executes.

Diagram Description automatically generated

NEW QUESTION # 131

What valid RAML retrieves details on a specific by its orderId as a URL parameter?

- A)
- B)
- C)
- D)

- A. Option D
- B. Option B
- C. Option A
- D. Option C

Answer: B

NEW QUESTION # 132

What is the correct syntax to define and call a function in Database?

- A)
- B)
- C)
- D)

- A. Option D
- B. Option B
- C. Option A
- D. Option C

Answer: C

Explanation:

Keyword to add function in Dataweave transformation is fun. Hence option 2 and 4 are invalid. Also parameters needs to be passed exactly in same order as defined in function definition. Hence correct answer is ' fun addKV(object: Object, key: String, value: Any) = object ++ {(key):(value)}

```
addKV ( {"hello": "world"}, "hola", "mundo")
```

MuleSoft Documentation Reference : <https://docs.mulesoft.com/mule-runtime/4.3/dataweave-functions> DataWeave Function

Definition Syntax To define a function in DataWeave use the following syntax:

```
fun myFunction(param1, param2, ...) = <code to execute>
```

The fun keyword starts the definition of a function.

myFunction is the name you define for the function.

Function names must be valid identifiers.

(param1, param2, ... , paramn) represents the parameters that your function accepts.

You can specify from zero to any number of parameters, separated by commas (,) and enclosed in parentheses.

The = sign marks the beginning of the code block to execute when the function is called.

<code to execute> represents the actual code that you define for your function.

NEW QUESTION # 133
