Quiz 2026 Terraform-Associate-003: HashiCorp Certified: Terraform Associate (003) (HCTA0-003) – High Pass-Rate Hot Spot Questions

Our product backend port system is powerful, so it can be implemented even when a lot of people browse our website can still let users quickly choose the most suitable for his Terraform-Associate-003 learning materials, and quickly completed payment. It can be that the process is not delayed, so users can start their happy choice journey in time. Once the user finds the learning material that best suits them, only one click to add the Terraform-Associate-003 learning material to their shopping cart, and then go to the payment page to complete the payment, our staff will quickly process user orders online.

HashiCorp Certified: Terraform Associate (003) (HCTA0-003) Sample Questions (Q56-Q61):

NEW QUESTION # 56

Which option cannot be used to keep secrets out of Terraform configuration files?

- A. Environment variables
- B. A -var flag
- C. secure string
- D. A Terraform provider

Answer: C

Explanation:

A secure string is not a valid option to keep secrets out of Terraform configuration files. A secure string is a feature of AWS Systems Manager Parameter Store that allows you to store sensitive data encrypted with a KMS key. However, Terraform does not support secure strings natively and requires a custom data source to retrieve them. The other options are valid ways to keep secrets out of Terraform configuration files. A Terraform provider can expose secrets as data sources that can be referenced in the configuration. Environment variables can be used to set values for input variables that contain secrets. A `-var` flag can be used to pass values for input variables that contain secrets from the command line or a file. References =

NEW QUESTION # 57

All standard backend types support state locking, and remote operations like plan, apply, and destroy.

- A. True
- B. False

Answer: B

Explanation:

Not all standard backend types support state locking and remote operations like plan, apply, and destroy. For example, the local backend does not support remote operations and state locking. State locking is a feature that ensures that no two users can make changes to the state file at the same time, which is crucial for preventing race conditions. Remote operations allow running Terraform commands on a remote server, which is supported by some backends like remote or consul, but not all.

NEW QUESTION # 58

Which provider authentication method prevents credentials from being stored in the state file?

- A. Specifying the login credentials in the provider block
- B. None of the above
- C. Setting credentials as Terraform variables
- D. Using environment variables

Answer: B

Explanation:

None of the above methods prevent credentials from being stored in the state file. Terraform stores the provider configuration in the state file, which may include sensitive information such as credentials. This is a potential security risk and should be avoided if possible. To prevent credentials from being stored in the state file, you can use one of the following methods:

Use environment variables to pass credentials to the provider. This way, the credentials are not part of the provider configuration and are not stored in the state file. However, this method may not work for some providers that require credentials to be set in the provider block.

Use dynamic credentials to authenticate with your cloud provider. This way, Terraform Cloud or Enterprise will request temporary credentials from your cloud provider for each run and use them to provision your resources. The credentials are not stored in the state file and are revoked after the run is completed. This method is supported for AWS, Google Cloud Platform, Azure, and Vault.

Reference = : [Sensitive Values in State] : Authenticate providers with dynamic credentials

NEW QUESTION # 59

A developer on your team is going to take down an existing deployment managed by Terraform and deploy a new one. However, there is a server resource named `aws_instance.ubuntu[1]` they would like to keep. What command should they use to tell Terraform to stop managing that specific resource?

- A. Terraform state rmaws_instance.ubuntu[1]
- B. Terraform apply rmaws_instance.ubuntu[1]
- C. Terraform plan rmaws_instance.ubuntu[1]

- D. Terraform destroy rmaws_instance.ubuntu[1]

Answer: A

Explanation:

To tell Terraform to stop managing a specific resource without destroying it, you can use the terraform state rm command. This command will remove the resource from the Terraform state, which means that Terraform will no longer track or update the corresponding remote object. However, the object will still exist in the remote system and you can later use terraform import to start managing it again in a different configuration or workspace. The syntax for this command is terraform state rm <address>, where <address> is the resource address that identifies the resource instance to remove. For example, terraform state rm aws_instance.ubuntu

[1] will remove the second instance of the aws_instance resource named ubuntu from the state. References

Command: state rm : Moving Resources

NEW QUESTION # 60

You decide to move a Terraform state file to Amazon S3 from another location. You write the code below into a file called backend.tf.

Which command will migrate your current state file to the new S3 remote backend?

- A. terraform init
- B. terraform refresh
- C. terraform state
- D. terraform push

Answer: A

Explanation:

This command will initialize the new backend and prompt you to migrate the existing state file to the new location. The other commands are not relevant for this task.

NEW QUESTION # 61

.....

One of the key factors for passing the exam is practice. Candidates must use Terraform-Associate-003 practice test material to be able to perform at their best on the real exam. This is why ValidTorrent has developed three formats to assist candidates in their Terraform-Associate-003 Preparation. These formats include desktop-based Terraform-Associate-003 practice test software, web-based practice test, and a PDF format.
