#### 問題 #77

Refer to the exhibit.

You are operating an internal network with multiple OSPF routers on the same LAN segment. FGT\_3 needs to be added to the OSPF network and has the configuration shown in the exhibit. FGT\_3 is not establishing any OSPF connection. What needs to be changed to the configuration to make sure FGT\_3 will establish OSPF neighbors without affecting the DR/BDR election?

- A. ☐
- B. ☐
- C. ☒
- D. ☐

答案：C

#### 解題說明：

The OSPF configuration shown in the exhibit is using the default priority value of 1 for the interface port1.

This means that FGT\_3 will participate in the DR/BDR election process with the other OSPF routers on the same LAN segment. However, this is not desirable because FGT\_3 is a new device that needs to be added to the OSPF network without affecting the existing DR/BDR election. Therefore, to make sure FGT\_3 will establish OSPF neighbors without affecting the DR/BDR election, the priority value of the interface port1 should be changed to 0. This will prevent FGT\_3 from becoming a DR or BDR and allow it to form OSPF adjacencies with the current DR and BDR. Option B shows the correct configuration that changes the priority value to 0. Option A is incorrect because it does not change the priority value. Option C is incorrect because it changes the network type to point-to-point, which is not suitable for a LAN segment with multiple OSPF routers. Option D is incorrect because it changes the area ID to 0.0.0.1, which does not match the area ID of the other OSPF routers on the same LAN segment.

#### 問題 #78

Refer to The exhibit, which shows a topology diagram.

A customer wants to use SD-WAN for traffic generated from the data center towards Branches. SD-WAN on HUB should follow the underlay condition on each Branch and the solution should be scalable for hundreds of Branches.

Which SD WAN-Rules strategy should be used?

- A. Lowest Cost SLA
- B. Auto based on link quality
- C. Best Quality based on route-tags
- D. Manual based on route-tags

答案：C

#### 問題 #79

Refer to The exhibit, which shows a topology diagram.

A customer wants to use SD-WAN for traffic generated from the data center towards Branches. SD-WAN on HUB should follow

the underlay condition on each Branch and the solution should be scalable for hundreds of Branches.  
Which SD WAN-Rules strategy should be used?

- A. Lowest Cost SLA
- B. Auto based on link quality
- **C. Best Quality based on route-tags**
- D. Manual based on route-tags

答案： C

#### 問題 #80

Refer to the exhibit.

□ You need to create a base SD-WAN configuration that includes SD-WAN rules and Performance SLAs for spoke sites with various connectivity types. It needs to be done in a way that can be easily applied to new sites with a minimum amount of change. How should you create the SD-WAN zones?

- A. With members without interface assignments
- B. With members and assign interfaces but do not specify a gateway
- C. With no members configured
- **D. With members and assign overlay interfaces**

答案： D

#### 問題 #81

Refer to the exhibits.

□ The exhibits show a FortiGate network topology and the output of the status of high availability on the FortiGate. Given this information, which statement is correct?

- A. The ethertype values of the HA packets are 0x8890, 0x8891, and 0x8892
- **B. The cluster members are on the same network and the IP addresses were statically assigned.**
- C. FGVMEVLQOG33WM3D and FGVMEVGCJNHFYI4A share a virtual MAC address.
- D. The cluster mode can support a maximum of four (4) FortiGate VMs

答案： B

解題說明：

The output of the status of high availability on the FortiGate shows that the cluster mode is active-passive, which means that only one FortiGate unit is active at a time, while the other unit is in standby mode. The active unit handles all traffic and also sends HA heartbeat packets to monitor the standby unit. The standby unit becomes active if it stops receiving heartbeat packets from the active unit, or if it receives a higher priority from another cluster unit. In active-passive mode, all cluster units share a virtual MAC address for each interface, which is used as the source MAC address for all packets forwarded by the cluster. References:
