The WGU Practical Applications of Prompt QFO1 Practical-Applications-of-Prompt certification is a valuable credential earned by individuals to validate their skills and competence to perform certain job tasks. Your WGU Practical Applications of Prompt QFO1 Practical-Applications-of-Prompt certification is usually displayed as proof that you've been trained, educated, and prepared to meet the specific requirement for your professional role. The WGU Practical Applications of Prompt QFO1 Practical-Applications-of-Prompt Certification enables you to move ahead in your career later.

WGU Practical Applications of Prompt QFO1 Sample Questions (Q23-Q28):

NEW QUESTION # 23

An AI system is used to aid in an applicant selection process. The users of the system, however, have no information about which criteria are used to evaluate applicants. Which ethical concern is associated with this issue?

- A. Fairness
- B. Transparency
- C. Accountability

- D. Safety

Answer: B

Explanation:

This scenario highlights a critical failure in Transparency. When an AI system acts as a "gatekeeper" for life-changing opportunities—such as employment, university admissions, or bank loans—it is an ethical imperative that the criteria for selection be disclosed. If the users (the hiring managers or the applicants) do not know which variables the AI is prioritizing (e.g., years of experience, specific keywords, or even zip codes), the system is effectively a "Black Box." The lack of transparency here creates several downstream risks. First, it makes it impossible to verify if the system is actually being "Fair." If the criteria are hidden, the AI could be using proxy variables that result in illegal discrimination without anyone noticing. Second, it undermines "Accountability," as a rejected applicant has no way to challenge the decision or understand what they need to improve. In professional prompt engineering, this issue is addressed by designing prompts that require the AI to generate an "Evaluation Report" alongside its selection, detailing which parts of the resume matched the job description. This transforms the automated process from an opaque hurdle into a transparent, auditable tool.

NEW QUESTION # 24

What is a benefit of incorporating detailed descriptions in prompts?

- A. Better articulation of user needs
- B. Better use of computing resources
- C. Wider range of response generation
- D. Reduced risk of errors

Answer: A

Explanation:

Incorporating detailed descriptions within a prompt is a fundamental practice in prompt engineering that leads to the better articulation of user needs. When a user provides a high level of detail, they are essentially mapping out their mental model for the AI. Generative AI models function by predicting the most statistically likely response based on the input provided; therefore, the more specific the input, the more "locked in" the AI becomes to the user's specific intent. Detailed descriptions help remove ambiguity, ensuring the AI doesn't have to "guess" what the user wants.

For example, instead of asking for a "business plan," a detailed description would specify the industry, target audience, funding goals, and specific competitive advantages. This allows the AI to align its output exactly with the user's requirements. While detailed prompts can occasionally help reduce certain types of errors (Option B), their primary strength lies in communication clarity. It bridges the gap between a vague idea and a concrete output. In practical applications, this reduces the number of iterations required to reach a final product, as the AI receives a clear set of requirements from the start, leading to a much more useful and tailored result.

NEW QUESTION # 25

A team of historians wants to use AI-based tools to aid in the research of the history of Europe's agricultural equipment. What is the importance of writing effective prompts in the research?

- A. It reduces the need for reliance on multiple sources.
- B. It determines the level of importance of the research.
- C. It ensures that researchers remain focused.
- D. It ensures that interpretations are innovative.

Answer: C

Explanation:

In academic and historical research, the sheer volume of available data can easily lead to "scope creep" or tangential exploration. Writing effective prompts is crucial because it ensures that researchers remain focused on their specific inquiry. When dealing with a broad subject like "Europe's agricultural equipment," an unstructured prompt might return a generalized history of farming. However, an effective prompt—specifying the region (e.g., Western Europe), the era (e.g., the Industrial Revolution), and the specific type of equipment (e.g., steam-powered threshing machines)—acts as a navigational guide for the AI.

This focus is essential for maintaining the integrity of the research process. It prevents the AI from generating irrelevant "filler" content and forces the output to adhere to the specific historical parameters defined by the team. While AI can assist in synthesizing information, it cannot determine the "importance" of research (which is a human value judgment) nor should it replace the need for

multiple sources (as verification is still required). By refining the prompt to include specific constraints and objectives, historians can use AI as a precision tool to uncover specific data points and trends, ensuring that the resulting analysis stays aligned with the original research goals.

NEW QUESTION # 26

Which task can be accomplished with the data cleaning capabilities of generative AI?

- A. Reducing total volume
- B. Identifying underlying bias
- C. Identifying inaccuracies
- D. Drawing valid conclusions

Answer: C

Explanation:

Generative AI models, specifically Large Language Models (LLMs), are highly effective at identifying inaccuracies within a dataset during the data cleaning phase. When provided with a dataset and a prompt to "check for consistency" or "identify anomalies," the AI can cross-reference the data points against its internal knowledge base or the logical rules established in the prompt. For example, if a list of "US States" includes "London," the AI can flag this as an inaccuracy.

This capability extends to identifying spelling errors, formatting inconsistencies (e.g., dates written in multiple formats), and logical contradictions. While AI can help in identifying bias (Option D), that is usually considered a higher-level "auditing" task rather than a standard "cleaning" task. Identifying inaccuracies is a foundational step in the data pipeline; by cleaning the data first, the user ensures that any subsequent analysis or "conclusion drawing" (Option C) is based on high-quality, reliable information. In prompt engineering, this is often performed using the "Self-Correction" or "Reviewer" pattern, where one prompt generates data and a second prompt is used specifically to identify and fix any factual or structural inaccuracies within that output.

NEW QUESTION # 27

A person asks a large language model to develop a product description for a laptop. The person refines the prompt several times, each time adding more details, context, and restrictions to improve the result. Which prompting technique is described?

- A. Least to most
- B. Chain of thought (COT)
- C. Cognitive verifier pattern
- D. Few-shot

Answer: A

Explanation:

The scenario describes Least to most prompting. This technique involves breaking down a complex task into smaller, manageable sub-problems and solving them sequentially. In this case, the user starts with a basic request and progressively adds layers of complexity—details, context, and restrictions—to guide the AI toward a sophisticated final output. It is essentially a strategy of "building up" the prompt complexity until the model has enough specific information to meet the high-level requirement.

Unlike "Chain of Thought" (COT), which focuses on the AI showing its internal reasoning steps for a single logic problem, "Least to most" is about the user-led structural decomposition of a task. It is highly effective for creative or technical writing where a "zero-shot" (single try) approach often yields generic results. By refining the prompt iteratively, the user ensures the AI understands each constraint before moving to the next level of detail. In practical applications, this technique is used to "warm up" the model's context window with specific domain data, ensuring that by the time the final description is generated, the AI is fully aligned with the technical specs and brand voice required for the laptop.
