### ISQI ISTQB Foundation Level - Acceptance Testing Sample Questions (Q44-Q49):

#### NEW QUESTION # 44

Which one of the following statements BEST explains how the quality of requirements / user stories and acceptance criteria affects acceptance testing?

- A. Testers may complete unclear requirements by assumptions, as long as they discuss those assumptions with at least one stakeholder
- B. In Agile development lifecycle models, requirement engineering becomes less important due to the product owner role.
- C. Vague or ambiguous requirements may lead to misunderstandings both during implementation and testing
- D. INVEST is a technique that ensure the quality of user stories or requirements, thus replacing regular reviews

**Answer: C**

Explanation:

Clear, complete, and testable requirements or user stories are critical for effective acceptance testing.

Ambiguities or vague statements lead to differing interpretations by stakeholders, developers, and testers. This often results in software that doesn't meet user expectations or in tests that fail to verify business needs correctly.

Option B is correct because it highlights the importance of precise requirements in both implementation and testing phases.

Ambiguities can result in incorrect behavior, untestable features, or test cases that don't align with business goals.

Other options:

A is risky - while testers may explore assumptions during exploratory testing, relying on assumptions rather than clarification increases risk.

C is incorrect - the INVEST mnemonic helps write better user stories, but it doesn't replace review or validation processes.

D is false - Agile still values requirements engineering; it's more collaborative and incremental, with the product owner playing a key role, not diminishing its importance.

B). Vague or ambiguous requirements may lead to misunderstandings both during implementation and testing

#### NEW QUESTION # 45

As an acceptance tester you want to test the \$100 withdrawal process described by the following BPMN model.

You would like to achieve decision coverage. Consider the following test cases: Test 1: balance = \$100, receipt = YES Test 2: balance = \$99 Test 3: balance = \$120, receipt = NO Test 4: balance = \$2500, receipt = YES Which of the following is the minimal set of test cases allowing to achieve full decision coverage?

- A. Test 1, Test 2
- B. Test 1, Test 2, Test 4
- C. Test 2, Test 3
- D. Test 1, Test 2, Test 3

**Answer: D**

#### NEW QUESTION # 46

Which one of the following answers lists characteristic of quality in use according to the quality in use model defined in ISO 25010?

- A. Satisfaction
- B. Freedom of interference
- C. Security
- D. User experience

**Answer: A**

Explanation:

According to ISO/IEC 25010:2011, the "Quality in Use" model includes characteristics that measure the system's impact on stakeholders during actual usage in a specific context.

The four main characteristics of Quality in Use are:

Effectiveness

Efficiency

Satisfaction

Freedom from Risk

Option C is correct because "Satisfaction" is one of the core quality-in-use characteristics and refers to the degree to which user needs are fulfilled in context.

Other options:

A (User experience) is a broader term not formally defined as a Quality in Use characteristic in ISO 25010.

B (Security) is part of the product quality model, not quality in use.

D (Freedom of interference) is not a defined term in ISO 25010; it may be a misstatement of "freedom from risk."

#### NEW QUESTION # 47

Which one of the following statements regarding performance testing is MOST correct?

- A. Performance testing aims to determine a system's robustness against malicious attacks.
- B. Depending on the model used to simulate the workload, performance tests are called load, stress or endurance / stability tests.
- C. The performance test results serve to determine hardware and software performance requirements.
- D. The performance of the system is measured in a context that reflects, as far as possible, representative operating conditions.

**Answer: D**

#### NEW QUESTION # 48

Which one of the following statements describes correctly how acceptance testing may be augmented with other test techniques or approaches?

- A. In a priority-based testing approach, prioritization of acceptance tests depends on identified product risks.
- B. In a risk-based testing approach, acceptance criteria are derived from the tester's experience and intuition.
- C. In a black-box testing approach, acceptance test scenarios follow the implemented sequence of function calls in the code.
- D. In a model-based testing approach, acceptance tests are generated from graphical or textual models.

**Answer: D**

Explanation:

Model-Based Testing (MBT) is a test design technique in which test cases are derived from a model that describes some aspects of the system's behavior. In the context of acceptance testing, MBT can be used to generate high-level acceptance test cases automatically from business process models, use case diagrams, state models, or decision tables.

Option A is correct because MBT supports the systematic generation of acceptance test cases from these models, enabling better coverage of business rules and workflows while maintaining traceability to the requirements.

Other options:

B is close but slightly off: prioritization of acceptance tests in a priority-based approach depends on business value or stakeholder-defined priorities, not strictly on product risks.

C is incorrect. Risk-based testing relies on structured risk assessment, not just intuition or experience.

D is false. Black-box testing focuses on inputs and outputs without referencing the internal structure (such as function calls), which is characteristic of white-box testing.

Exact Reference - ISTQB CTFL Acceptance Testing Syllabus (Section 2.3):

"Model-based testing can be used to generate acceptance test cases systematically based on models representing business processes or system behavior."
