Amazon AWS Certified SysOps Administrator - Associate (SOA-C02) Sample Questions (Q513-Q518):

NEW QUESTION # 513

A company manages a set of accounts on AWS by using AWS Organizations. The company's security team wants to use a native AWS service to regularly scan all AWS accounts against the Center for Internet Security (CIS) AWS Foundations Benchmark. What is the MOST operationally efficient way to meet these requirements?

- A. Run the CIS AWS Foundations Benchmark across all accounts by using Amazon Inspector.
- B. Designate a central security account as the Amazon GuardDuty administrator account. Create a script that sends an invitation from the GuardDuty administrator account and accepts the invitation from the member account. Run the script every time a new account is created. Configure GuardDuty to run the CIS AWS Foundations Benchmark scans.
- **C. Designate an AWS Security Hub administrator account. Configure new accounts in the organization to automatically become member accounts. Enable CIS AWS Foundations Benchmark scans.**
- D. Designate a central security account as the AWS Security Hub administrator account. Create a script that sends an invitation from the Security Hub administrator account and accepts the invitation from the member account. Run the script every time a new account is created. Configure Security Hub to run the CIS AWS Foundations Benchmark scans.

Answer: C

Explanation:

To ensure comprehensive and automated security scanning across multiple AWS accounts:

Security Hub Administrator Account: Designate one account within AWS Organizations as the Security Hub administrator account. This centralizes security findings management.

Automate Account Association: Configure Security Hub to automatically associate new accounts in the organization as member accounts. This ensures all new and existing accounts are continuously monitored under the same security policies.

Enable CIS Benchmark Scans: Within Security Hub, enable the CIS AWS Foundations Benchmark standard.

This automatically scans all member accounts against this set of security best practices and compliance standards.

This configuration provides an operationally efficient and scalable way to manage security and compliance across an extensive AWS environment, leveraging the native integration of AWS services.

NEW QUESTION # 514

A company migrated a non-production application that is I/O intensive to a general purpose Amazon EC2 instance. A General Purpose SSD (gp3) Amazon Elastic Block Store (Amazon EBS) volume is attached to the EC2 instance. Users report that actions that require intensive reading and writing to the disk are taking longer than normal or are failing.

A SysOps administrator reviews the performance metrics of the EBS volume. The VolumeQueueLength metric is consistently high during the same times in which the users report issues. The SysOps administrator needs to resolve this problem to restore full performance to the application.

Which action will meet this requirement?

- A. Attach an Amazon ElastiCache cluster to the EBS volume.
- B. Modify the EBS volume properties by enabling the Auto-Enabled IO attribute.
- C. Modify the EC2 instance to enable enhanced networking. Reboot the EC2 instance.
- **D. Modify the EBS volume properties to increase the IOPS.**

Answer: D

Explanation:

The VolumeQueueLength metric being high indicates the volume can't process I/O operations fast enough, leading to performance degradation.

From Amazon EBS Performance Guide:

For gp3 volumes, performance can be adjusted by increasing IOPS or throughput independently of storage size.

The gp3 volume type allows provisioning up to:

* 16,000 IOPS

* 1,000 MB/s throughput

Why the other options are incorrect:

- * A: ElastiCache is a caching layer and doesn't attach to EBS volumes.
- * B: Auto-Enabled IO is only relevant when IO is disabled due to volume-level issues, not performance.
- * D: Enhanced networking helps network performance, not disk I/O latency.

NEW QUESTION # 515

A SysOps administrator needs to design a high-traffic static website. The website must be highly available and must provide the lowest possible latency to users across the globe.

Which solution will meet these requirements?

- A. Create an Application Load Balancer (ALB) and a target group. Create an Amazon EC2 Auto Scaling group with at least two EC2 instances in the associated target group. Store the website content on the EC2 instances. Use Amazon Route 53 to create an alias record that points to the ALB.
- **B. Create an Amazon S3 bucket, and upload the website content to the S3 bucket. Create an Amazon CloudFront distribution, and set the S3 bucket as the origin. Use Amazon Route 53 to create an alias record that points to the CloudFront distribution.**
- C. Create an Application Load Balancer (ALB) and a target group in two Regions. Create an Amazon EC2 Auto Scaling group in each Region with at least two EC2 instances in each target group. Store the website content on the EC2 instances. Use Amazon Route 53 to create a DNS record that uses a geolocation routing policy to route traffic to the correct ALB based on where the request originates.
- D. Create an Amazon S3 bucket, and upload the website content to the S3 bucket. Create an Amazon CloudFront distribution in each AWS Region, and set the S3 bucket as the origin. Use Amazon Route 53 to create a DNS record that uses a geolocation routing policy to route traffic to the correct CloudFront distribution based on where the request originates.

Answer: B

Explanation:

To design a high-traffic static website that is highly available and provides low latency globally, you can use Amazon S3, CloudFront, and Route 53. This solution leverages the global edge locations of CloudFront to deliver content with low latency.

- * Create an Amazon S3 Bucket:
- * Open the S3 console at Amazon S3 Console.
- * Create a new bucket and upload your website content.
- * Configure S3 for Static Website Hosting:
- * Go to the Properties tab of your bucket.
- * Enable Static website hosting and set the index document (e.g., index.html).
- * Create a CloudFront Distribution:
- * Open the CloudFront console at Amazon CloudFront Console.
- * Create a new distribution and set the S3 bucket as the origin.
- * Configure distribution settings, including caching behaviors and SSL/TLS settings.
- * Create Route 53 Alias Record:
- * Open the Route 53 console at Amazon Route 53 Console.
- * Select the hosted zone for your domain.
- * Create a new record set, choose ALIAS as the record type, and point it to the CloudFront distribution.

NEW QUESTION # 516

A SysOps administrator has used AWS CloudFormation to deploy a serverless application into a production VPC. The application consists of an AWS Lambda function, an Amazon DynamoDB table, and an Amazon API Gateway API. The SysOps administrator must delete the AWS CloudFormation stack without deleting the DynamoDB table.

Which action should the SysOps administrator take before deleting the AWS CloudFormation stack?

- A. Add a Snapshot deletion policy to the DynamoDB resource in the AWS CloudFormation stack.
- B. Enable termination protection on the AWS CloudFormation stack.
- **C. Add a Retain deletion policy to the DynamoDB resource in the AWS CloudFormation stack.**
- D. Update the application's IAM policy with a Deny statement for the dynamodb:DeleteTable action.

Answer: C

Explanation:

To delete the AWS CloudFormation stack without deleting the DynamoDB table, you need to apply a deletion policy to the DynamoDB resource. The Retain deletion policy ensures that the specified resource is not deleted when the stack is deleted. Instead, it is retained.

Steps:

* Modify the CloudFormation Template:

* Add a deletion policy to the DynamoDB table resource.

json

Copy code

```
{
  "Resources": {
    "MyDynamoDBTable": {
      "Type": "AWS::DynamoDB::Table",
      "DeletionPolicy": "Retain",
    }
  }
}
```

Update the Stack:

Update the CloudFormation stack with the modified template.

Reference: Updating a Stack

Delete the Stack:

Proceed to delete the stack. The DynamoDB table will be retained.

NEW QUESTION # 517

A SysOps administrator is reviewing AWS Trusted Advisor warnings and encounters a warning for an S3 bucket policy that has open access permissions. While discussing the issue with the bucket owner, the administrator realizes the S3 bucket is an origin for an Amazon CloudFront web distribution.

Which action should the administrator take to ensure that users access objects in Amazon S3 by using only CloudFront URLs?

- A. Assign an IAM role to the CloudFront distribution and grant the role permissions in the S3 bucket policy.
- **B. Create an origin access identity and grant it permissions to read objects in the S3 bucket.**
- C. Assign an IAM user to the CloudFront distribution and grant the user permissions in the S3 bucket policy.
- D. Encrypt the S3 bucket content with Server-Side Encryption with Amazon S3-Managed Keys (SSE-S3).

Answer: B
