A good deal of researches has been made to figure out how to help different kinds of candidates to get C1000-189 certification. We revise and update the C1000-189 test torrent according to the changes of the syllabus and the latest developments in theory and practice. We base the C1000-189 Certification Training on the test of recent years and the industry trends through rigorous analysis. Therefore, for your convenience, more choices are provided for you, we are pleased to suggest you to choose our C1000-189 exam question for your exam.

With our C1000-189 exam questions, the most important and the most effective reward is that you can pass the exam and get the C1000-189 certification. And it is also what all of the candidates care about. At the same time, you can also get some more practical skills. Your work efficiency will increase and your life will be more capable. Our C1000-189 Guide questions are such a very versatile product to change your life and make you become better.

Simplified Document Sharing and Accessibility With C1000-189 PDF (Dumps)

The customization feature of these IBM Instana Observability v1.0.277 Administrator - Professional (C1000-189) practice questions (desktop or web-based) allows users to change the settings of their mock exams as per their preferences. Customers of Real4exams can attempt multiple C1000-189 Exam Questions till their satisfaction. On each attempt, our C1000-189 practice exam will give your results on the spot.

IBM Instana Observability v1.0.277 Administrator - Professional Sample Questions (Q17-Q22):

NEW QUESTION # 17

Which logging framework is used by Instana agents?

- A. Serilog
- B. Loggly
- C. JSNLog
- **D. Log4j2**

Answer: D

Explanation:

IBM Instana Observability agents use Log4j2 as their primary logging framework for system activity, sensor status, and diagnostic output. The documentation confirms: "The default logging framework for Instana agents is Apache Log4j2, providing structured log

output, multi-level verbosity, and integration with most enterprise log aggregation environments." Log4j2 is a standard for Java-based environments, supporting dynamic log rotation, filtering, and formatting. Instana agent log files follow Log4j2 conventions, enabling easy parsing by SIEM tools and adapters. Serilog (A) is a .NET framework, not used by Instana agents. JSNLog (C) is for JavaScript applications, while Loggly (D) is a SaaS log analytics platform. Log4j2's mature design lets administrators tune performance, verbosity, and log destinations in rich deployment scenarios, directly aligning with best practices in Instana's monitoring ecosystem. This was reconfirmed in agent reference guides and environment setup sections.

NEW QUESTION # 18

Which two methods can Instana administrators use to create an API token?

- A. JSON Web tokens
- **B. Team API token**
- C. Sensor-specific API token
- **D. Personal API tokens**
- E. Unit-specific API tokens

Answer: B,D

Explanation:

IBM Instana supports two primary methods for creating API tokens necessary for secure automation and integration: Team API tokens and Personal API tokens. The official documentation states: "API tokens for REST API access can be generated either on a per-user (personal) basis, or at the team level for shared automation use." Personal tokens are created from the user profile menu and scoped to an individual's permissions, supporting traceability and revocation. Team tokens are created under team or group settings and represent organizational integrations or CI/CD pipeline automation. JSON Web Tokens (A) are an industry token standard but not a creation flow in Instana. Unit- or Sensor-specific tokens are not supported (C, D); all automation integrations must use Personal or Team tokens, which are easily managed and rotated via the web UI for improved security hygiene.

NEW QUESTION # 19

Which statement is true about webhook URL authentication?

- A. Only Authorization HTTP request header is supported.
- **B. Prepend username and password to the hostname URL for authentication.**
- C. Basic authentication is not supported due to security constraints.
- D. Specification of additional Headers is not supported for authentication.

Answer: B

Explanation:

According to IBM Instana's integration documentation, webhook notifications support Basic Authentication by embedding the username and password into the URL as part of the standard format (`https://user:password@hostname/path`). The exact extract from IBM states: "For webhooks requiring basic authentication, username and password must be specified by prepending these values to the webhook hostname in the URL." This approach is supported by most HTTP libraries and ensures ease of integration with third-party endpoints. Instana also allows other advanced authentication mechanisms for webhooks, but this is the documented approach for standard Basic Auth scenarios. Additional header configuration (B) is possible but not required for basic authentication, and option D is incorrect as Basic Auth is explicitly supported (and documented). Limiting to only the Authorization header (C) oversimplifies the supported authentication workflows.

NEW QUESTION # 20

For which event type does Instana create an alert because end users are impacted?

- **A. Incident**
- B. Issues
- C. Monitoring issues
- D. Changes

Answer: A

Explanation:

Based on IBM Instana documentation review, Incidents are the event type that triggers alerts when end users are impacted. The official IBM documentation states: "An incident helps you to understand situations impacting your edge services and critical infrastructure... Incidents are created as soon as Instana detects either a key performance indication (KPI) is breached on an edge service, or a critical infrastructure issue." However, the documentation also clarifies: "An issue is an event that is triggered if something out of the ordinary happens... An issue by itself does not trigger an alert, Instana simply notes that it happened. Should the service to where this system is connected behave badly, this issue is part of the incident." Critical issues can trigger alerts and may impact end users, but Incidents are specifically designed to represent situations where end-user-facing services (edge services) are impacted. The answer is B. Incident as the primary event type for end-user impact alerts.

NEW QUESTION # 21

Which type of custom resource supports the retention policy settings in the Custom Edition?

- A. UnitProp
- B. StorageConf
- C. ConfigYaml
- D. CoreSpec

Answer: D

Explanation:

According to the official IBM Instana Observability documentation (v1.0.304), retention policy settings in Custom Edition are NOT configured in a custom resource called "StorageConf." Instead, they are configured as properties within the CoreSpec of the Core custom resource. The documentation explicitly states: "Overwriting the default retention settings is optional and should only be done consciously. These retention setting values are configured as properties in the CoreSpec." The actual configuration looks like this:

text

kind: Core

metadata:

name: instana-core

namespace: instana-core

spec:

properties:

- name: retention.metrics.rollup5

value: "86400"

- name: config.appdata.shortterm.retention.days

value: "7"

- name: config.synthetic.retention.days

value: "60"

The retention policies for infrastructure metrics, application data, and synthetic monitoring are all configured as properties within the Core spec, not in a separate "StorageConf" custom resource. "StorageConf" refers to storage configurations for raw spans (S3, GCS, Azure), not retention policies.

NEW QUESTION # 22

.....

Yet at any moment, competition is everywhere so you may be out of work or be challenged by others at any time. This exam can improve your professional capacity with great chance if you choose our IBM Instana Observability v1.0.277 Administrator - Professional exam questions. We all know both exercises and skills are important to pass the exam while our C1000-189 Torrent prep contain the both aspects well.
