Our GH-200 real materials support your preferences of different practice materials, so three versions are available. PDF version - legible to read and remember, support customers' printing request. Software version of GH-200 real materials - supporting simulation test system, and support Windows system users only. App online version of GH-200 Guide question - suitable to all kinds of equipment or digital devices, supportive to offline exercises on the condition that you practice it without mobile data. You can take a look of these GH-200 exam dumps and take your time to decide.

Microsoft GH-200 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"> • Author and Maintain Workflows: This section of the exam measures skills of DevOps Engineers and Automation Specialists and covers building and managing workflows triggered by events such as pushes, scheduled times, manual triggers, and webhooks. It includes understanding workflow components like jobs, steps, actions, and runners, syntax correctness, environment variables, secrets management, and dependencies between jobs. Candidates will also demonstrate practical abilities to create workflows for various purposes, including publishing packages, using service containers, routing jobs, and deploying releases to cloud providers.
Topic 2	<ul style="list-style-type: none"> • Author and Maintain Actions: This domain evaluates the abilities of Action Developers and Automation Engineers to select and create suitable types of GitHub Actions, such as JavaScript, Docker containers, or run steps. It emphasizes troubleshooting action code, understanding the components and file structures of actions, and using workflow commands within actions to communicate with runners, including exit code management.
Topic 3	<ul style="list-style-type: none"> • Consume Workflows: This domain targets Software Developers and Quality Assurance Engineers and focuses on interpreting workflow runs and their outcomes. It covers identifying triggering events, reading workflow configurations, troubleshooting failures by analyzing logs, enabling debug logging, managing environment variables, caching dependencies, and passing data between jobs. Candidates also manage workflow runs, artifacts, approvals, and status badges, as well as locating workflows within repositories and leveraging organizational templated workflows.
Topic 4	<ul style="list-style-type: none"> • Manage GitHub Actions in the Enterprise: This section measures the expertise of Enterprise Administrators and Platform Engineers in distributing and managing GitHub Actions and workflows at the organizational level. It includes reuse and sharing of templates, strategies for managing reusable components via repositories and naming conventions, controlling access to actions, setting organization-wide usage policies, and planning maintenance to ensure efficient enterprise-wide deployment of GitHub Actions.

Microsoft GH-200 Valid Dumps Files, Reliable GH-200 Test Pattern

Everybody wants success, but not everyone has a strong mind to persevere in study. If you feel unsatisfied with your present status, our GH-200 actual exam can help you out. Our GH-200 learning guide always boast a pass rate as high as 98% to 100%, which is unique and unmatched in the market. Using our GH-200 Study Materials can also save your time in the exam preparation for the content is all the keypoints covered.

Microsoft GitHub Actions Sample Questions (Q29-Q34):

NEW QUESTION # 29

In GitHub Actions, where should you declare custom environment variables so they are accessible across all jobs and steps in a single workflow run?

- A. Environment secrets
- B. Repository variables
- C. Runner command line arguments
- D. Set env in the workflow YAML

Answer: D

Explanation:

The correct option is Set env in the workflow YAML because defining environment variables at the top level of a workflow makes them available to every job and step in that single run.

In a workflow file you can declare a top level mapping for environment variables with key value pairs. This top level scope propagates the values to all jobs and steps in the run and you can override them at job or step scope when necessary. This is the most direct way to share non secret configuration across the entire workflow execution.

NEW QUESTION # 30

As a developer, you need to make sure that only actions from trusted sources are available for use in your GitHub Enterprise Cloud organization. Which of the following statements are true?

(Each correct answer presents a complete solution. Choose three.)

- A. Specific actions can individually be enabled for the organization, including version information.
- B. Actions can be published to an internal marketplace.
- C. Actions can be restricted to only those available in the enterprise.
- D. GitHub-verified actions can be collectively enabled for use in the enterprise.
- E. Individual third-party actions enabled with a specific tag will prevent updated versions of the action from introducing vulnerabilities.
- F. Actions created by GitHub are automatically enabled and cannot be disabled.

Answer: A,B,D

Explanation:

[A] Internal Actions Marketplace

The reason for having an internal actions marketplace is to have a central location for all the actions that can be used inside our production organization. This is to prevent any actions from the public marketplace from being used in our production organization, without being checked for security risks first.

[B] Allow Marketplace actions by verified creators: You can allow all GitHub Marketplace actions created by verified creators to be used by workflows. When GitHub has verified the creator of the action as a partner organization, the badge is displayed next to the action in GitHub Marketplace.

[C] You can enable specific actions for the organization by identifying them and providing version control, ensuring only trusted versions are used in workflows.

Reference:

<https://devopsjournal.io/blog/2021/10/14/GitHub-Actions-Internal-Marketplace>

<https://docs.github.com/en/enterprise-cloud@latest/organizations/managing-organization-settings/disabling-or-limiting-github-actions-for-your-organization>

NEW QUESTION # 31

Which files are required for a Docker container action in addition to the source code? (Each correct answer presents a partial solution. Choose two.)

- A. Actionfile
- B. metadata.yml
- C. action.yml
- D. Dockerfile

Answer: C,D

Explanation:

Creating a Docker container action

Create a dockerfile

Dockerfile support for GitHub Actions

When creating a Dockerfile for a Docker container action, you should be aware of how some Docker instructions interact with GitHub Actions and an action's metadata file.

Creating an action metadata file

Create a new action.yml file.

Reference:

<https://docs.github.com/en/actions/tutorials/use-containerized-services/create-a-docker-container-action>

<https://docs.github.com/en/actions/reference/workflows-and-actions/dockerfile-support>

NEW QUESTION # 32

What can be used to set a failed status of an action from its code?

- A. JavaScript dist/ folder

- B. composite run step
- C. Dockerfile CMD
- **D. a non-zero exit code**
- E. @actions/github toolkit
- F. output variable

Answer: D

Explanation:

A non-zero exit code is used to set the status of an action to "failed" in GitHub Actions. When the action's script or code exits with a non-zero status, it indicates failure, and GitHub will mark the action as failed.

NEW QUESTION # 33

What are two reasons to keep an action in its own repository instead of bundling it with other application code? (Each correct answer presents a complete solution. Choose two.)

- A. It allows sharing workflow secrets with other users.
- **B. It decouples the action's versioning from the versioning of other application code.**
- **C. It makes it easier for the GitHub community to discover the action.**
- D. It widens the scope of the code base for developers fixing issues and extending the action.
- E. It makes the action.yml file optional.

Answer: B,C

Explanation:

Storing an action in its own repository makes it easier for the GitHub community to discover the action [B], narrows the scope [Not C] of the code base for developers fixing issues and extending the action, and decouples the action's versioning from the versioning of other application code

[D].
