NEW QUESTION # 79

Your application development team is performing "test-driven" development. This is a core principal of which software development model?[1]

- A. Agile
- B. Sequential
- C. Spiral
- D. Iterative

Answer: A

Explanation:

Test-driven development (TDD) is a core principle of Agile software development. In TDD, test cases are created before the code is written, and the code is developed to pass these tests. This approach emphasizes requirements and solutions evolving through collaborative effort and is a key practice in Agile methodologies¹².

References: The Agile Alliance describes TDD as a style of programming tightly interwoven with coding, testing, and design, which is a fundamental aspect of Agile development³. Wikipedia also notes that TDD is related to the test-first programming concepts of extreme programming, an Agile methodology. This is because test-driven development (TDD) is a style of programming in which coding, testing, and design are tightly interwoven. TDD is a core principle of agile software development, which is an iterative and adaptive approach that values customer collaboration, working software, and responding to change. NEW QUESTION # 80

What is a "depth-first" risk-based testing technique?

- A. Highest risk test cases are executed first
- B. All risk items are tested at least once
- C. Non-functional test cases are executed first
- D. Lowest risk test cases are executed first

Answer: A

Explanation:

A depth-first risk-based testing technique is a method of prioritizing and executing test cases based on the risk level of the features or functions to be tested. In this technique, the test cases with the highest risk are executed first, followed by the test cases with lower risks. This ensures that the most critical and likely areas of failure are tested thoroughly and early in the testing process. NEW QUESTION # 81

You are looking to Improve the efficiency of testing. The developers have been claiming that the majority of defect reports they receive are invalid either due to the test environment or because the tester did not follow the right steps In a standard defect management process where should you look for more information about these invalid defects?

- A. In the ones with the status of Re-Opened
- B. In the ones that are Resolved but not Closed
- C. In the ones that are stuck in the In Progress state
- D. In the ones that are in the status Rejected or Closed without a fix

Answer: D

Explanation:

* Context Analysis:

* The developers claim many defect reports are invalid. Reviewing defects that are rejected or closed without fixes can highlight issues like incorrect environment setup or missed testing steps.

* Evaluation of Options:

* A. In the ones that are stuck in the In Progress state:

* Incorrect. These defects are still being investigated, not confirmed as invalid.

* B. In the ones that are Resolved but not Closed:

* Incorrect. These defects have been fixed but not yet verified; they are not considered invalid.

* C. In the ones that are in the status Rejected or Closed without a fix:

* Correct. Rejected defects are marked invalid and are directly related to the problem described.

* D. In the ones with the status of Re-Opened:

* Incorrect. Re-opened defects indicate recurring or unresolved issues, not invalid reports.

* Syllabus Alignment:

* ISTQB highlights analyzing defect statuses to improve defect reporting and management processes (TM-2.3.5).

NEW QUESTION # 82

Which one of the following options would help ensure success in using an Exploratory Testing approach? SELECT ONE OPTION

- A. Exploratory test sessions produce test charters that provide a detailed set of instructions for the novice tester to follow.
- **B. Exploratory test sessions are time boxed and have a test charter stating the test conditions to be covered.**
- C. Exploratory test sessions produce test charters that are executed after all functional testing is complete.
- D. Exploratory test sessions are time boxed and have a test charter that only experienced test analysts can execute.

Answer: B

NEW QUESTION # 83

While mining the defect database for patterns of problems in the last release, a Test Manager notices that many of the most damaging failures were caused by defects injected during the low-level design phase.

Which of the following actions will likely give this project the most effective solution to this problem? [3]

- A. Formal inspections of the code modules affected by the last release
- B. Increased white-box coverage during system testing
- **C. Mandatory reviews of all important design work products**
- D. Increased static analysis during the implementation phase

Answer: C

Explanation:

The most effective solution to this problem is to implement mandatory reviews of all important design work products. This is because reviews are a type of static testing technique that can detect and prevent defects early in the software development lifecycle, before they become more costly and difficult to fix. By reviewing the low-level design work products, such as detailed design specifications, the project team can ensure that they are consistent, complete, and correct, and that they meet the requirements and the quality standards.
