Besides, we offer free demo for you, we recommend you to have a try before buying B2B-Commerce-Developer Training Materials. You can enjoy free update for 365 days if you choose us, so that you can obtain the latest information timely. And the latest version for B2B-Commerce-Developer exam dumps will be sent to your email automatically. You just need to receive them,

Salesforce Accredited B2B Commerce Developer Sample Questions (Q198-Q203):

NEW QUESTION # 198

Which two event settings are required for a custom event called CustomEvent to fire from the Lightning web component and propagate up to the DOM?

- A. composed: true
- B. composed: false
- C. bubbles: true
- D. cancelable: true

Answer: A,C

Explanation:

Explanation

To fire a custom event called CustomEvent from the Lightning web component and propagate it up to the DOM, the developer must set two event settings: bubbles and composed. The bubbles setting determines whether the event bubbles up through the component's ancestors in the DOM tree. The composed setting determines whether the event crosses the shadow boundary and reaches the light DOM. Setting both bubbles and composed to true allows the event to be handled by any element in the DOM that listens for it. The cancelable setting is not required for firing or propagating the event, as it only determines whether the event can be canceled by calling preventDefault() on it. Setting composed to false would prevent the event from reaching the light DOM and limit its propagation to the shadow DOM. Salesforce References: Lightning Web Components Developer Guide: Create and Dispatch Events, Lightning Web Components Developer Guide: Event Propagation

NEW QUESTION # 199

A Developer created a custom field that a project wants to expose on a given page.

How does the Developer ensure that the field is available to display on a given page?

- A. Override the Logic Class that the page uses and update the Service Management in CCAdmin for the given storefront to use this new Service Class
- B. Create a new Logic Class that the page uses and update the Service Management in CCAdmin for the given storefront to use this new Service Class
- C. Create a new Service Class that the page uses and update the Service Management in CCAdmin for the given storefront to use this new Service Class
- **D. Override the Service Class that the page uses and update the Service Management in CCAdmin for the given storefront to use this new Service Class.**

Answer: D

NEW QUESTION # 200

Based on error emails flowing in, a developer suspects that recent edits made to a checkout flow have created a defect. The developer has data points available to use as inputs in reproducing the scenario.

What should the developer do next?

- **A. Open the flow, select Debug, provide the session ID for replay, and select Run.**
- B. Open the flow, select Debug with Inputs, provide the Input values, and select Run.
- C. Open the flow, select Attach to Live Session, provide the session ID, and select Attach.
- D. Open the flow, select Debug, provide the Input values, and select Run.

Answer: A

Explanation:

The next step that the developer should do after suspecting that recent edits made to a checkout flow have created a defect and having data points available to use as inputs in reproducing the scenario is to open the flow, select Debug, provide the Input values, and select Run. A flow is a type of application that automates a business process by collecting data and performing actions in Salesforce or an external system. A flow can be used to customize the checkout process in the storefront by defining the steps and logic that are executed when a customer places an order. A flow can be edited or modified using Flow Builder, a point-and-click tool that allows developers to create and manage flows. Flow Builder also provides debugging and testing tools that allow developers to run and troubleshoot flows before deploying them. To debug or test a flow, the developer can open the flow in Flow Builder, select Debug from the toolbar, provide the Input values for the flow variables, and select Run. This will execute the flow in debug mode, which simulates how the flow runs in the org with real data. The developer can use debug mode to verify if the flow works as expected or if there are any errors or issues with the flow logic or actions. Open the flow, select Attach to Live Session, provide the session ID, and select Attach is not a valid next step, as it is not a feature or option available in Flow Builder or Salesforce CLI. Attach to Live Session is a feature that allows developers to attach a debugger to a running Apex session and inspect the state of the code execution. Open the flow, select Debug with Inputs, provide the Input values, and select Run is not a valid next step either, as it is not a feature or option available in Flow Builder or Salesforce CLI. Debug with Inputs is a feature that allows developers to debug an Apex class or trigger with predefined input values and breakpoints. Open the flow, select Debug, provide the session ID for replay, and select Run is not a valid next step either, as it is not a feature or option available in Flow Builder or Salesforce CLI. Replay is a feature that allows developers to replay an Apex log file and inspect the state of the code

execution at each line. Salesforce References: [B2B Commerce Developer Guide: Customize Checkout Flows], [Salesforce Help: Flow Builder], [Salesforce Help: Debug Your Flows], [Salesforce Developer Blog: Apex Replay Debugger]

NEW QUESTION # 201

In a B2B Commerce store, which three tasks must a developer complete to implement the use of a third-party service for either tax, shipping, or pricing calculation?

- A. Create an Apex class implementing the appropriate interface.
- B. Create an Apex class with an invocable method
- C. Create a named credential for authentication with an external service
- D. Create a flow to call the external service directly
- E. Register an Apex class as the integration in the store administration

Answer: A,C,E

Explanation:

Explanation

To implement the use of a third-party service for either tax, shipping, or pricing calculation in a B2B Commerce store, a developer must complete these three tasks:

* Create an Apex class that implements the appropriate interface for the calculation type. For example, for tax calculation, the developer must implement the `sfdc_checkout.CartTax` interface and define the `getTax` method. This method takes a `Cart` object as an input parameter and returns a list of `CartTax` objects with the calculated tax amounts.

* Create a named credential for authentication with the external service. A named credential specifies the URL of a callout endpoint and its required authentication parameters. The developer can use the named credential in the Apex class to make the callout to the external service and handle the response.

* Register the Apex class as the integration in the store administration. The developer must specify the Apex class name in the corresponding field for the calculation type. For example, for tax calculation, the developer must enter the Apex class name in the Tax Calculation Integration field. This way, the store can invoke the Apex class to perform the calculation for each cart.

The other options are not valid tasks for implementing the use of a third-party service. Creating a flow to call the external service directly is not supported for B2B Commerce, and creating an Apex class with an invocable method is not required for the calculation integration. References:

* Integrate with External Services

* CartTax Interface

* Named Credentials

* [Store Administration]

NEW QUESTION # 202

How do the REST APIs in Salesforce B2B Commerce support pass-through parameter handling

- A. Parameters are filtered out before the request is processed
- B. Parameters are passed through the service handlers
- C. Parameters are separated, but unused
- D. An exception is generated for unknown API keys

Answer: B

NEW QUESTION # 203

.....

Desktop practice test software, and web-based practice test software. All three ExamBoosts B2B-Commerce-Developer practice test questions formats are easy to use and compatible with all devices and operating systems. The ExamBoosts B2B-Commerce-Developer desktop practice test software and web-based practice test software both are the B2B-Commerce-Developer Practice Exam.
