Amazon AWS Certified Security - Specialty Sample Questions (Q231-Q236):

NEW QUESTION # 231

A company needs a forensic-logging solution for hundreds of applications running in Docker on Amazon EC2. The solution must perform real-time analytics on the logs, must support the replay of messages, and must persist the logs.

Which IAM services should be used to meet these requirements? (Select TWO)

- **A. Amazon Elasticsearch**
- B. Amazon SQS
- C. Amazon Athena
- D. Amazon EMR
- **E. Amazon Kinesis**

Answer: A,E

Explanation:

Explanation

Amazon Kinesis and Amazon Elasticsearch are both suitable for forensic-logging solutions. Amazon Kinesis can collect, process, and analyze streaming data in real time. Amazon Elasticsearch can store, search, and analyze log data using the popular open-source tool Elasticsearch. The other options are not designed for forensic-logging purposes. Amazon Athena is a query service that can analyze data in S3, Amazon SQS is a message queue service that can decouple and scale microservices, and Amazon EMR is a big data platform that can run Apache Spark and Hadoop clusters.

NEW QUESTION # 232

You have an S3 bucket defined in IAM. You want to ensure that you encrypt the data before sending it across the wire. What is the best way to achieve this?

Please select:

- **A. Use the IAM Encryption CLI to encrypt the data first**
- B. Enable server side encryption for the S3 bucket. This request will ensure that the data is encrypted first.
- C. Enable client encryption for the bucket
- D. Use a Lambda function to encrypt the data before sending it to the S3 bucket.

Answer: A

Explanation:

One can use the IAM Encryption CLI to encrypt the data before sending it across to the S3 bucket. Options B and C are invalid because this would still mean that data is transferred in plain text. Option D is invalid because you cannot just enable client side encryption for the S3 bucket. For more information on Encrypting and Decrypting data, please visit the below URL:

The correct answer is: Use the IAM Encryption CLI to encrypt the data first. Submit your Feedback/Queries to our Experts

NEW QUESTION # 233

Developers in an organization have moved from a standard application deployment to containers. The Security Engineer is tasked with ensuring that the containers are secure. Which strategies will reduce the attack surface and enhance the security of the containers? (Select TWO.)

- **A. Segregate containers by host, function, and data classification.**

- B. Limit resource consumption (CPU, memory), networking connections, ports, and unnecessary container libraries.
- C. Use Docker Notary framework to sign task definitions.
- **D. Use the containers to automate security deployments.**
- E. Enable container breakout at the host kernel.

Answer: A,D

Explanation:

these are the strategies that can reduce the attack surface and enhance the security of the containers.

Containers are a method of packaging and running applications in isolated environments. Using containers to automate security deployments can help ensure that security patches and updates are applied consistently and quickly across the container fleet.

Segregating containers by host, function, and data classification can help limit the impact of a compromise and enforce the principle of least privilege. The other options are either irrelevant or risky for securing containers.

NEW QUESTION # 234

A company needs a security engineer to implement a scalable solution for multi-account authentication and authorization. The solution should not introduce additional user-managed architectural components. Native IAM features should be used as much as possible. The security engineer has set up IAM Organizations with all features activated and IAM SSO enabled.

Which additional steps should the security engineer take to complete the task?

- A. Use AD Connector to create users and groups for all employees that require access to IAM accounts. Assign AD Connector groups to IAM accounts and link to the IAM roles in accordance with the employees' job functions and access requirements. Instruct employees to access IAM accounts by using the IAM Directory Service user portal.
- **B. Use an IAM SSO default directory to create users and groups for all employees that require access to IAM accounts. Assign groups to IAM accounts and link to permission sets in accordance with the employees' job functions and access requirements. Instruct employees to access IAM accounts by using the IAM SSO user portal.**
- C. Use an IAM SSO default directory to create users and groups for all employees that require access to IAM accounts. Link IAM SSO groups to the IAM users present in all accounts to inherit existing permissions. Instruct employees to access IAM accounts by using the IAM SSO user portal.
- D. Use IAM Directory Service for Microsoft Active Directory to create users and groups for all employees that require access to IAM accounts. Enable IAM Management Console access in the created directory and specify IAM SSO as a source of information for integrated accounts and permission sets. Instruct employees to access IAM accounts by using the IAM Directory Service user portal.

Answer: B

NEW QUESTION # 235

A company maintains an open-source application that is hosted on a public GitHub repository. While creating a new commit to the repository, an engineer uploaded their IAM access key and secret access key. The engineer reported the mistake to a manager, and the manager immediately disabled the access key.

The company needs to assess the impact of the exposed access key. A security engineer must recommend a solution that requires the least possible managerial overhead.

Which solution meets these requirements?

- A. Analyze a credential report in IAM Identity and Access Management (IAM) to see when the access key was last used.
- B. Analyze Amazon CloudWatch Logs for activity by searching for the access key.
- **C. Analyze an IAM Identity and Access Management (IAM) use report from IAM Trusted Advisor to see when the access key was last used.**
- D. Analyze VPC flow logs for activity by searching for the access key.

Answer: C

Explanation:

Explanation

To assess the impact of the exposed access key, the security engineer should recommend the following solution:

Analyze an IAM use report from AWS Trusted Advisor to see when the access key was last used. This allows the security engineer to use a tool that provides information about IAM entities and credentials in their account, and check if there was any unauthorized activity with the exposed access key.
